Safety is an intensely positive, not a negative principle. The leaders of the safety movement have never used the slogan "safety first," except in the steel mills, railroad shops and factories where it was first and rightly used. As a general pholisophy of life, safety does not mean a timid shrinking from the strenuous life normal—to every healthy person, it means living life to the full, but living it the right way which is the safe way. Safety forbids nothing except what is forbidden by common sense and decent consideration for others.

In the steel industry, birth-place of the modern safety movement, the fatalities per million hours worked have decreased 50 per cent in the past ten years. This is the average of the group of companies doing safety work. Individual companies in the steel and other industries have reduced the frequency and severity of accidents by 75 per cent and even 90 per cent. The direct economic savings have exceeded the cost of the safety work, to say nothing of the improvement in morale.

Today accidents are a more prolific cause of suffering and death than war. During the 19 months in which the United States was more or less actively engaged in the world conflict, the total mortality among American soldiers from all causes was 77,101. During the same 19 months, 136,000 persons lost their lives through accidental means although they were engaged in the pursuits of peace.

Industrial accidents cost the business men of America more than a billion dollars annually, points out C. B. Scott, President of the National Safety Council, who states that most of this loss can be saved as accidents don't happen, but are caused by hazards which can be eliminated through educational methods and safeguards. Mr. Scott's hope that more business men will enlist in the country-wide safety movement is worthy of the consideration of people in this industry.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

Insure Your Chances

Your chances *for success* are always better when you are insured.

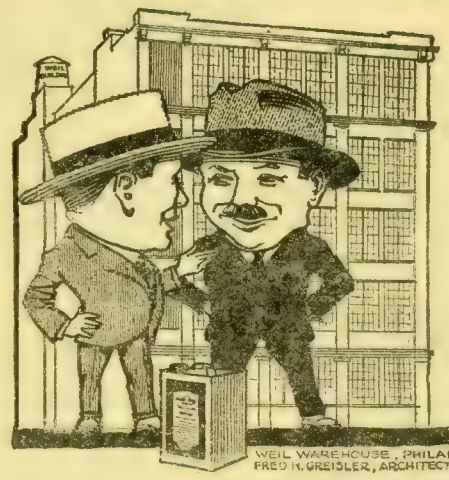
The chances of *misfortune* are always *lessened* when you are insured.

Chance may help you or hinder you at a moment's notice.

Insure your chances. Then you will be aided toward fortune and protected against misfortune at all times.

Insurance Company of North America

PHILADELPHIA



and the

Indemnity Insurance Company of North America

Write practically every form of Insurance except life

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

WEIL WAREHOUSE, PHILADELPHIA, PA.
FRED N. GREISLER, ARCHITECT & ENGINEER — ROBBINS CONTRACTING CO., PHILA., BUILDERS

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating over-time work.

Twenty-two years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-5.

H. Rex Stackhouse and W. W. Donohoe, Architects, formerly 1120 Locust street, Philadelphia, have moved to 266 South Fifteenth street. Pennypacker 7439.

Thursday, May 20th, at 1.00 P. M., the Annual Spring Outing of Philadelphia Builders' Exchange and Employers' Association, will be held at the Cedarbrook Country Club, Limekiln Pike and City Line.

The afternoon will be devoted to golf, the evening to a high class vaudeville entertainment with a man sized dinner separating the two. Those not golfers will enjoy quoits, cards, baseball or other sports. Something for everybody.

The charge for tickets will be $5.00 each. This will entitle the holder to the entire rights and privilege of the Club for the day except, of course, golfers, who will be asked to pay the customary greens fee of $2.00 at the locker room.

Don't crowd your space, Mr. Advertiser Better play up one selling point at a time than to try to get everything into one ad and kill every possible chance for display An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Insure Your Chances

Your chances *for success* are always better when you are insured.

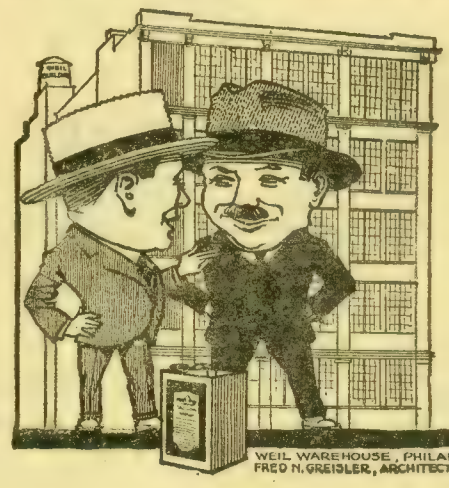
The chances of *misfortune* are always *lessened* when you are insured.

Chance may help you or hinder you at a moment's notice.

Insure your chances. Then you will be aided toward fortune and protected against misfortune at all times.

Insurance Company of North America

PHILADELPHIA



and the

Indemnity Insurance Company of North America

Write practically every form of Insurance except life

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating overtime work.

Twenty-two years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

No One Can Absolutely Prevent Fire

EARTH, air, fire and water are the four elements by which man lives.

All these elements are bigger than man and fire is the most dangerous of the four.

Your home and your possessions represent actual money wealth.

Insure to full value.

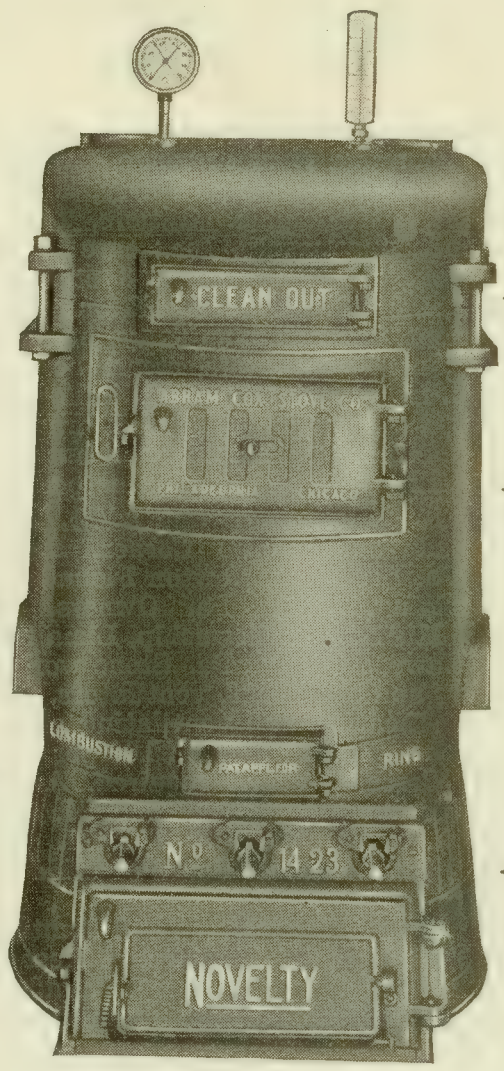
Phone—Woodland 4667 7038 GRAYS AVENUE, PHILADELPHIA



1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-5.

Drawings and specifications may be obtained from the Superintendent of the Mint or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

CONVENIENT HOUSES MAKE BETTER HOMES

"Convenience at moderate cost is one of the most important features that a better homes demonstration house can show to a community," says Dr. Louise Stanley, chief of the Bureau of Home Economics of the United States Department of Agriculture.

For two years Doctor Stanley has been on the Advisory Committee of Better Homes in America and has helped to pick the prize houses. Convenience is one of the things she looks for first in sizing up a house plan. She believes of course that a home should be attractive inside and out, and that every effort should be made to provide sound construction and safeguards against fire and other risks. In planning, building, and furnishing a house, Dr. Stanley says more thought needs to be given to the features that make for comfort and ease of care. The work of cooking, cleaning, and keeping the house in order can then be cut to a minimum. The following are some of the points that seem to her most important:

"Plan the house to meet the needs of the people who are to live in it, and be sure that the exterior design fits the site. Consider the placing of the rooms as regards sunshine and prevailing winds.

"Give careful thought to the arrangement of rooms in the three chief areas for living, sleeping, and work. Make these groups convenient in themselves and to each other.

"Measure large pieces of furniture and plan the rooms to fit them.

"The living room should be large, light, and airy. If necessary, sacrifice the size of the dining room to make a large living room, or have only a dining alcove, or make a combination living and dining room.

"Econominze also on something else if necessary and have a generous substantial fireplace in the living room. With a good central heating system a fireplace is not needed for heat except perhaps between seasons, but every home needs the beauty and cheer of an open fire. An ash chute to the basement lessens the work of caring for a fireplace. If possible, arrange a cupboard or a closet off the living room for papers, magazines, games, music, and extra firewood.

"A pass closet or cabinet for china, silver, and table linen built into the wall between the dining room or alcove and the kitchen is a great convenience.

"The kitchen is a whole problem in itself, but to put it briefly it should be as compact as possible with equipment set at comfortable height and grouped into well-lighted, well-ventilated centers for the various jobs. Convenience also depends in large measure on adequate storage facilities for utensils and supplies and on good connections with the rest of the house.

"Light, air, and privacy are the prime considerations in the bedrooms. A clothes closet wide enough for a pole and hangers, not just a shallow cubby hole that tries to pass for a closet, should connect with every bedroom.

"A closet for linen and bedding is also needed in this section of the house. Every house should also have a storage place for trunks, suitcases, and clothing not in use. If the house has two stories try to have a closet for cleaning supplies and tools on the second floor as well as the first.

"A sleeping porch is very desirable. It will be more convenient and comfortable if screened against flies and mosquitoes and fitted with windows or canvas curtains to keep our rain and snow. Broad overhanging eaves are also a protection against wind, weather, and light, and give privacy.

"Keep the bathroom small so that there will be less floor and wall space to clean. If possible have a built-in tub which leaves no part of wall and floor difficult to reach for cleaning. By all means have a cupboard for toilet supplies and the small articles that often clutter the bathroom, and a small closet for storing towels.

"Halls provide passageway from room to room and insure privacy. They should occupy only a relatively small proportion of the total floor space. An entrance hall even if no larger than vestibule is desirable in every house, and if possible there should be a coat closet opening off this hall.

"The stairway, whether boxed in or open, should have steps of a height and width that are easy to travel, and should be well lighted at night as well as during the day.

"In choosing the material and finish for floor, walls, and inside trim think of them in terms of care and upkeep and measure the cost of these as well as the original outlay. Fortunately for the homemaker, the tendency nowadays is for plain effects.

These points mentioned so far have to do especially with the inside of the house. Porches, steps, and walks, however, greatly influence comfort, convenience and the work required to keep the house clean."

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

The BUILDERS' GUIDE is in its fortieth year of continuous publication.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

Fatima Cigarettes Are Made In An "ANTI-HYDRO" Waterproofed Factory

The basement in the Liggett & Myers factory was *permanently* waterproofed and dampproofed in *one operation* and at one cost of less than 1½ cents a square foot by using "ANTI-HYDRO" in the one-inch concrete floor topping.

Large bales of tobacco, which must be kept dry to prevent rotting, are stored in this basement. They weigh from 600 to 700 pounds and are continually trucked over the concrete floor. Since "ANTI-HYDRO" both hardens and waterproofs concrete at the same time, it protects the floor from wear as well as water.

"ANTI-HYDRO" is easy and economical to use. Being a liquid integral agent it mixes readily with the gauging water without the aid of skilled labor. Twenty-two years of continuous use on every type of concrete work has made "ANTI-HYDRO" the accepted standard. Use it on your next job for *guaranteed* satisfaction.

As The Editor Sees It

ADVANTAGES OF BETTER PLASTERING FOR APARTMENT BUILDINGS

A thought which will be given much consideration in the next few years is that pertaining to the means by which resale value of apartments, buildings and homes can be maintained, according to the "American Builder." True, there are sporadic instances where builders have given thought to this problem, but the turnover of improved property has been so rapid that the need for upkeep has not often asserted itself forcibv. In other words, the general thought has been that if a man ordered an apartment house constructed, he must sell it quickly before any question arose as to whether its condition affected its resale value. Thus, the plumbing fixtures, the lighting fixtures, the wall decorations and other items subject to upkeep would be practically new when resold and it would not be necessary for the builder to study this problem to any extent.

Conditions in the realty field today have operated to alter conditions considerably. Large numbers of new apartment buildings have been erected throughout the country; some localities have been well-nigh overbuilt with the result that the renter has more opportunity to pick and choose. Magazines and newspaper advertising have educated him in the niceties of better appointed apartments, with the result that For Rent signs bespeckle many an apartment building which was in its hey-day only three or four years since. Obsolescence has entered very largely into the problem of the apartment house. No longer is the building judged only by its outward appearance. Among the accoutrements of the well-appointed apartment which have done much to affect resale value of this type of structure is plumbing. The development of the buyer's interest has resulted in a demand for plumbing fixtures of the type which a few years past were used only in the very highest type of residential construction. The renter in the modern apartment demands the very best in bathroom equipment and one of the first things he notes, especially in older buildings, is the quality of the plumbing.

Lighting fixtures also catch the eye quickly. A few years ago large inverted bowls for either direct or semi-direct lighting were then considered the last word in illumination. Now these have been largely replaced by wall brackets occasionally supplemented by ornate candelbra, and individual floor and table lamps. For these the public has been educated to look for numerous convenience outlets, also necessary for electric housecleaning devices. The "period" of the house is thus often determined by a glance at the type of lighting equipment provided.

The style of wood trim used also denotes the generation in which the building was built. Twenty years ago the most intricate moldings were used around windows and door openings and for picture molding. Passe now are the old time familiar plate rails with which every dining room was adorned.

But even ancient plumbing and lighting fixtures might be overlooked if kept in good shape although often replaced by those of present-day design. This, it has been quite feasible to do on account of the relative ease by which such modernization could be affected. Not so, however with cracked and discolored plaster on walls and ceilings. As a breeding place for vermin unsightly cracks are a distinct deterrent to the prospective renter. To her, they suggest that poor, cheap, shoddy

construction was used and she will probably make a mental note to the effect that in a very short time the customary streaking of the ceiling will reappear. She also probably reflects that if interior materials were used on the walls and ceilings that other drawbacks such as noisy rooms because of poor sound deadening, poorly fitting doors and windows and other common ailments of cheap construction are also present.

And so our prospective tenant shops around until she finds a new apartment where disfiguring plaster cracks and streaks have not yet had a chance to exhibit themselves, and the owner of the older building must exert himself so much more diligently, possibly offer substantial rent concessions to attract tenants who will overlook the faulty workmanship and material, which were built into the building. A ten per cent vacancy is usually considered about the average in apartments, but if the building has been built as described, the vacancies may run as high as twenty per cent under the conditions which now obtain in many cities. In other words, the newer buildings instead of having a ten per cent vacancy, have perhaps a two or three per cent, while the older buildings in which shoddy construction was permitted, bring the average up to ten per cent by having an exceptionally large percentage of unoccupied apartments.

Such a condition makes insecure the investment of owners in apartment house property and is even apt to be reflected in the market value of bonds issued for their construction. The question then arises, how much additional will be the actual cost of using Better Plastering so that obsolescence and depreciation can be largely averted and thus maintain the rentability of apartments and insure the safety of the investment in the building.

Statistics compiled from reliable and authoritative sources throughout the country, indicate that it costs somewhat more to apply plaster on metal lath than it does on ordinary lath. This difference arises because plastering on metal lath is usually three-coat work, while plastering on ordinary lath is in most cases two-coat work. In general, more plaster is used to cover metal lath than is used on wood lath. This follows because the open mesh in the metal lath permits the plaster to squeeze through so as to imbed the lath and place it in its logical position in the plaster slab, viz., about midway between the front and back surfaces, and to provide a substantial key to prevent falling plaster. A full thickness of plaster on metal lath insures rigidity and prevents plaster cracks, and this advantage is passed on to the owner.

Against this, there is the common practice of applying wood lath so closely together that there is practically no opportunity for the plaster to form an adequate key. This enables the plasterer to "skin" the job as he can cover the surface with a minimum of plaster and with a minimum of keys. Naturally, such a procedure weakens the bond of the plaster to the lath and when placed so close together there is a marked tendency for the lath to swell and crack off the key. This then leaves merely a surface bond between the wood lath and the plaster, which is subject to disintegration and plaster cracks. On the other hand, first class wood lath if placed at least three-eights of an inch apart as specified by reliable architects and plastering contractors, permits the plasterer to fill up the joints and make a satisfactory key which will insure relative freedom from plaster cracks. When done carefully, the difference in cost between wood lath and metal lath is reduced substantially.

Even with a full thickness of plaster and adequate keys on wood lath, there is still the ever-present possibility of streaking. This is caused by the great difference in the conductivity of the wide strips of lath and the narrow strips of plaster between them. Experiments have shown that with a cold attic or circulation be-

Residence and Garage, Arlingham, Pa. Architect, R. R. Neely, 2301 Spruce street, Philadelphia. Owner, name withheld. Frame, stone, stucco, 1½ stories, 37x43 feet, slate roof, hardwood floors, hot water heat, electric light. Plans completed. Architect taking sub-bids for owner.

School Building, Boothwyn, Pa. Architects, H. Rex Stackhouse and W. W. Donohoe, 266 South Fifteenth street, Philadelphia. Owners, Upper Chichester Township, Board of Education, F. B. Albany, Boothwyn, Pa. Brick, 1 story and basement, 8 class rooms, slag roof, maple floors, steam heat, electric light. Plans in progress. Will be ready for bids about two weeks.

Glenside School, Reading, Pa. Architect, F. A. Muhlenberg, Ganster Building, Reading, Pa. Owners, Board of Education, O. B. Heim, secretary, Eighth and Washington streets, Reading, Pa. Brick, steel, cast stone, 2 stories and basement, 95x60 feet, 46x59 feet, slag roof, composition, cement and maple floors, hollow tile. Low bidders: Tamaqua Const. Co., Tamaqua, Pa., $119,869. Plumbing, Wasner & Reddig, 206 North Sixth street, Reading, $14,-925. Heating, Corbit Brothers, Third and Oley streets, Reading, $24,750. Electric, Reading Electric Co., 503 Penn street, Reading, $5,200.

Women's Club and Memorial Building, (Alts.), Cynwyd, Pa., Architects, Savery & Scheetz, Stephen Girard Bldg., Phila. Owner, Women's Club of Bala Cynwyd, Mrs. S. Stephenson, Pres.; Dr. A. Quinn, Pres. of Board of Trustes, Cynwyd, Pa. Brich, stone, cut stone, 1 story and basement, 69x45 feet, Memorial Bldg., 32x57 fee. (Plumbing, heating, elcectric liberty equipment reserved.) Varigated slate and slag roof, pine, cement and maple floors, metal lath, tile work, floor hardener, ornamental iron work, duraflex floors, painting and glazing, bluestone, flagstone, limestone, area gratings, magnesite floors. Architects taking bids due May 28th.

Residence and Garage, Wallingford, Pa. Architect, William W. Price, 119 S. 4th St., Phila. Owners, Mr. and Mrs. Charles D. Mitchell, Wallingford, Pa. Stone, 2½ stories and basement, 100x35 feet, irregular asbestos shingle roof(oak and pine floors, hot water heat, electric light, tile work, ornamental iron work, flagstone. Architect taking bids due June 1st.

Paving, Twp. of Tinicum, Pa. Engineers, Damon & Foster, 6932 West Chester Pike, Pa. Owner, Board of Commissioners Twp., A. T. Reese, Sec'y, Tinicum, Pa. Certified check, $400. Owner taking bids due June 7th, 8 P. M.

Pennsylvania Contracts Awarded

Dining Hall, Eaglesville, Montgomery County, Pa. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owners, Eaglesville Sanatorium for Consumptives, care of Dr. A. J. Cohen, 1613 Spruce street, Philadelphia. Stone, brick, cut stone, steel, 1 story and basement, 91x73 feet, variegated slate roof, cement, composition and linoleum floors, hollow tile, elevators, plumbing, painting and glazing, Anti-Hydro waterproofing, dampproofing, ornamental iron work, iron stairs, bond, metal lath, steam heat, electric light, brass thresholds, demolition, incinerator, kitchen equipment, refrigerators, bluestone, area gratings, wrought iron pipe. Contract awarded Knox Landers, 1132 Vine street, Philadelphia.

Store Front (alts.), 349 North Hampton street, Easton, Pa. Architect, Harold Holmes, Detroit, Mich. Owners, S. S. Kresge Co., Detroit, Mich. Steel, brick, concrete, granite, 1 story, 28 feet, pine, maple and cement floors, steam heat, metal lath, tile work, vitrolite bond, copper fronts, sheet rock, bronze grills, tablets and strips, mill work, carpentry, metal ceilings, sheet metal work, plumbing, painting and glazing. Contract awarded A. P. Smith, Easton, Pa.

Store and Apartment (alts. and add.), Shenandoah, Pa. Architect, John B. Thompson, 34 South Seventeenth street, Philadelphia. Owner, Jack Ivenstark, Shenandoah, Pa. Frame, 3 stories, 15x80 feet, tin or slag roof, hardwood and pine floors, hot water heat, electric light, metal ceilings, plate glass, flush bulks. Contract awarded J. Gale Wendel, 19 East Lloyd street, Shenandoah, Pa.

Lodge, 21 South Fourth street, Hamburg, Pa., $54,000. Architect, Carl P. Berger, 1512 Walnut street, Philadelphia. Owners, L. O. O. M., J. R. Ebling, secretary, Hamburg, Pa. Brick, limestone, 3 stories and basement, 32x180 feet, tin roof, concrete, cork, maple, terrazzo floors, steam heat, electric light, tile. Contract awarded Henry Wanner, Hamburg, Pa.

Church, Hope and Charles streets, Coatesville, Pa. Architect, Peter F. Getz, Victory Building, Philadelphia. Owners, St. Joseph's Roman Catholic Church, Coatesville, Pa. Stone, brick, 1 story and basement, 45x85 feet, slate roof. Contract awarded to Frank Seraski, Embreeville, Pa.

Residence, Twentieth and Market streets, Harrisburg, Pa. Architect, C. J. Lappley, Parkside Building, Harrisburg, Pa. Owner, O. K. Kines, care of architect. Brick, stone, 2 stories, 26x36 feet, tile roof, hardwood floors, tile work, electric light, cut stone. Contract awarded to J. S. Foose, Front and Emerald streets, Harrisburg.

Factory (add.), Bally, Pa. Architects, High & Huber, 230 North Sixth street, Reading, Pa. Owners, Bally Ribbon Mills Co., care of architects. Brick, steel, 1 story and basement, 50x60 feet, slag roof, maple floors, electric light, steel sash, fire doors. Contract awarded to H. Sattler, Quakertown, Pa.

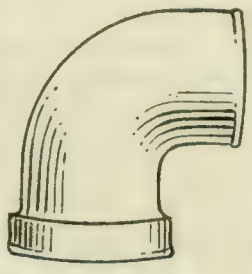
Residence, Wyomissing, Pa. Architect, H. Maurer, 234 North Fifth street, Reading, Pa. Owner, T. C. Christ, Wyomissing, Pa. Stone, 2½ stories, 35x60 feet, slate roof, hardwood floors, vapor vacuum heat, electric light, tile work. Contract awarded to C. H. Schlegel, 2250 Perkiomen avenue, Reading.

Dormitory, Fifth and St. John streets, Allentown, Pa. Architects, Ruhe & Lange, Allentown, Pa. Owners, Good Shepherd Home, Rev. J. H. Raker, Allentown, Pa. Brick, 3 stories, 64x40 feet. Contract awarded to W. H. Gangwere, Allentown, Pa.

Emergency Electric System in Auditorium, Fort Washington, Pa. Architect, Watson K. Philips, 215 South Fifth street, Philadelphia. Owners, School Board of Upper Dublin Township, William Worman, superintendent. Contract awarded C. Marvin Riley, Fort Washington, Pa.

High School, York, Pa. Architect, J. B. Hamme, City Bank Building, York, Pa. Owners, School Board, City of York, D. H. Crider, secretary, York, Pa. Completion of auditorium and gymnasium. Contract awarded to C. W. Strayer, 2302 North Second street, Harrisburg, Pa.

Residence, Seventh and Chew streets, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owner, Dr. Elmer Bausch, 252 North Seventh street, Allentown, Pa. Brick, 2 stories, 76x40 feet, built-up roof, hardwood floors, electric light, tile work. Contract awarded to L. W. Hunsicker, 821 Chew street, Allentown, Pa.



Church, Glenside, Pa. Architects, Seeburger & Rabenold, 1524 Chestnut street, Philadelphia. Owners, Board of Home Missions of the Reformed Church, Glenside. Stone, cut stone, limestone, 1 story and basement, 40x60 feet, black slate and slag roof, oak, cement and pine floors, metal lath, ornamental iron work, cast stone, flagstone. Contract awarded E. J. Hiltebeitel, 1501 West Hunting Park avenue, Philadelphia.

Residence, York, Pa. Architect, Edward Leber, Hay Building, York, Pa. Owner, J. McF. Thomson, care of architect. Brick, 2½ stories, 35x28 feet, slate roof, hardwood floors, tile work, electric light. Contract awarded to L. D. Menough, York, Pa.

Bank, Dallastown, Pa. Architect, J. B. Hamme, City Bank Building, York, Pa. Owners, Dallastown Union State Bank, Mr. Meyers, president, Dallastown, Pa. Brick, 1 and 2 stories, 20x60 feet, composition roof, terrazzo floors, tile and marble, steam heat (heating reserved), electric light, bronze work. Contract awarded to C. F. Deller, Dallastown, Pa.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa. Dauphin County, A-3856, West Hanover Township. One course reinforced concrete. Contract awarded to York Eng. & Const. Co., York, Pa., $97,893.35.

New Jersey Construction News

Bell Telephone Exchange, Twelfth and Wesley avenue, Ocean City, N. J. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owners, Bell Telephone Co., Seventeenth and Parkway, Philadelphia. Brick, steel. Work contemplated.

Church and School, White Horse pike, West Berlin, N. J. Owners, Our Lady of Mt. Carmel Roman Catholic Church, Rev. Lewis Hayes, West Berlin, N. J. Work contemplated.

School (add.), Brooklawn, N. J. Architects, Edwards & Green, 548 Federal street, Camden, N. J. Owners, School Board, Borough of Brooklawn, Gloucester County, N. J. Brick, 2 stories, 60x84 feet, slate roof. Plans in progress. Owners will take bids in two weeks.

Factory Building, Twenty-eighth and Buren avenue, Cramer Hill, Camden, N. J. Owners, John E. Lingo & Son, foot of Elm street, Camden, N. J. Architect, private plans. Brick, steel, 1 story, 70x100 feet, steel sash, slag roof, concrete floors. Owners ready for sub-bids due at once.

Parkway School (add.), Ewing Township, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, Ewing Township School Board, Mr. Latham, clerk, care of architects. Brick, steel, 2 stories, 48x36 feet, slag roof, maple floors, hollow tile, safety treads, roof ventilators, waterproofing and dampproofing, iron stairs, iron work, fire doors, hollow metal sash, metal lath (heating, plumbing and electric separate). Architects will be ready for bids in one week.

Office Building, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, New Jersey Manufacturers' Association, care of architects. Reinforced concrete, steel, brick, 3 stories and basement, 50x75 feet, built-up roof, linoleum floors, hollow tile, dumb waiters, safety treads, vault doors, steel stairs, iron work, hollow metal doors, metal lath, vapor heat, electric light. Architect will take bids next week.

Hotel (add.), Cooper and Federal streets, Camden, N. J. Architects and engineers, H. L. Stevens & Co., 522 Fifth avenue, New York City. Owners, Walt Whitman Hotel, J. R. Taylor, manager, Camden, N. J. Stone, brick, steel, will contain dining room, kitchen, auditorium, etc. Architects and engineers will build.

Theatre and Stores, Hightstown, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, John and Mary Hight Amusement Co., Trenton, N. J. Brick, hollow tile, structural steel, 2 stories, 50x135 feet, 50x70 feet, slag roof, cement and tile floors, roof ventilators, steam heat, electric light, metal lath, rolled steel sash, fire doors, ornamental iron work, concrete stairs. Architect taking bids.

Fire House, Riverside, Burlington County, N. J. Architect, Herbert O. Ziegler, Drexel Building, Philadelphia. Owners, Riverside Fire Co. No. 1, Riverside, N. J. Brick, stone, tile, stucco, steel, 2 stories and basement, 115x40 feet, built-up roof, mastic floors, safety treads, metal ceilings, integral waterproofing, metal lath, rolled steel sash and skylights, bond, ornamental iron work, Duntile work, dumb waiter, hardware, painting. Owners taking bids due June 2nd, 8 P. M. (Standard Time).

Sales Room and Office Building, New Brunswick, N. J. Architect, R. A. Schumann, 202 West State street, Trenton, N. J. Owner, Elwood E. Waller, New Brunswick, N. J. Brick, steel, 2 stories and basement, 67x166 feet, Johns Manville roof, concrete, maple and terrazzo floors, hollow tile, iron stairs, bronze, plate glass, fire doors, rolled steel sash, tile and marble, metal lath, electric light, steam heat. Architect taking bids.

Armory, Burlington, N. J., $50,000. Architects, Division of Architecture and Construction, Trenton. Owners, State Military Board, Trenton, N. J. Brick, steel, 1 story and basement, 60x100 feet, slag roof, maple floors, cement floors, steam heat, electric light. Owners taking bids due June 9th.

Grade School (add.), Wildwood, N. J. Architects, V. B. Smith, Atlantic City, and L. H. Boyer, Wildwood, N. J. Owners, Board of Education, William Todd, secretary, Wildwood, N. J. Brick, steel, 3 stories and basement, 124x137 feet (plumbing, heating and electric separate bids), slag roof, concrete and maple floors, hollow tile, safety treads, metal lath, marble work, kalamein doors. Architects taking bids due June 11.

Storehouse (add.), Trenton, N. J. Architects, Division of Architecture and Construction, Trenton. Owners, Department of Institutions and Agencies, State Home for Girls, Trenton, N. J. Brick, steel, 1 story, 30x50 feet, slate roof, concrete floors (heating, plumbing and electric separate). Architects taking bids due June 2nd.

Infirmary, Trenton, N. J. Architects, Department of Institutions and Agencies, Division of Architecture and Construction, Trenton, N. J. Owners, State Home for Girls, Trenton, N. J. Brick, 2½ stories, slate roof, tile and marble, waterproofing, dampproofing, ornamentla iron work, iron stairs (heating, plumbing and electric separate). Architects taking revised bids due June 2nd.

Bank (alts. and add.), Wildwood, N. J. Architects, Morgan French Co., 19 West Forty-fourth street, New York. Owners, Marine Trust Co., Wildwood, N. J. Brick, granite, limestone, steel, 1 story, mezzanine and basement, 80x70 feet, slag roof, cement floors, steam heat, electric light, tile work, copper skylights, kalamein doors, demolition, acoustical treatment, ornamental iron work. Owners taking bids due June 2nd.

Building No. 3 (add.), Camden, N. J. Architect, private plans. Owners, American Brown Boveri Elec. Corp., Camden, N. J. Brick, 1 story, 180x60 feet, asbestos asphalt roof, cement floors, metal lath, rolled steel sash. Owners taking bids due as soon as possible.

New Jersey Contracts Awarded

Apartment House, Ocean City, N. J. Architect, Roy G. Pratt, Franklin Trust Building, Philadelphia. Owners, Acme Holding Corp., 25 Broad street, New York City. Brick, 6 stories, irregular, 40 apartments, electric light, tile and marble work, hardwood floors, fire tower. Contract awarded to Friel-McLeister, Inc., 334 South Smedley street, Philadelphia, who will be ready for sub-bids in two weeks.

Apartment House, Pacific avenue, between South Carolina and Tennessee avenues, Atlantic City, N. J. Architect, W. Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, Nathan Levin, Atlantic City, N. J. Reinforced spread foundations, steel frame, brick, limestone, 11 stories, 100x100 feet, 72 apartments, slag roof, cork floors, steam heat, gypsum and hollow tile partitions, electric light, tile and marble worg, 2 elevators, incinerator, refrigeration, fur storage vault, plate glass, roof tanks, metal bulks, ornamental iron work. Contract awarded Charles P. Tilton, Atlantic City, N. J., who is taking sub-bids. Plans may be seen at office of architect.

Belfont Hotel (add.), 106 South Tennessee avenue, Atlantic City, N. J. Architect, W. Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, F. J. Friez, on premises. Brick, steel, 5 stories, 72 rooms, slag roof, composition floors, elevators, steam heat, electric light, tile work, plumbing, stucco, iron stairs and miscellaneous iron work. Contract awarded Taylor Meyer, Pittsburgh, Pa.

Church (add. and alts.), 520-22 State street, Camden, N. J., $6,000. Architect, George I. Lovatt, 223 South Sydenham street, Philadelphia. Owners, Holy Name Church, on premises. Brick, 2 stories, 8x12 feet, slag roof, extensive interior alterations. Contract awarded to M. J. Jubanyik, Sixth and Penn streets, Camden, N. J.

Store (add. and alts.), 522 North Sixth street, Camden, N. J., $4,000. Architect, Howard E. Hall, 819 Cooper street, Camden, N. J. Owner, Jack Rappaport, on premises. Brick, 1 story add., 15x18 feet, slag roof, general alterations. Contract awarded to M. W. Cooperson Co., Sixth and Jackson streets, Camden, N. J.

Garage and Add. to Residence, 431 Vine street, Camden, N. J., $3,500. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owner, Joseph E. Nowrey, 921 Cooper street, Camden, N. J. Brick, 3 stories add., 16x17 feet, slag roof, garage, 16x15 feet. Contract awarded to John Lindeborn, 932 Kimber street, Camden, N. J.

Building, 1006 South Second street, Camden, N. J., $3,000. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owners, Camden Bronze & Casting Co., on premises. Block, 1 story, 20x60 feet, slag roof, electric lighting. Contract awarded to Victor Bezahler, 1027 Atlantic avenue, Camden, N. J.

Residence, 2927 Saunders street, Camden, N. J., $4,500. Architect, private plans. Owner, Mary E. Young, Camden, N. J. Brick, 2 stories, 16x36 feet, slag roof, hot air heat, electric work. Contract awarded to Macksie Glass, 4 Beach street, Moorestown, N. J.

Store Front (alts.) to Residence, 427 Haddon avenue, Camden, N. J., $3,000. Architect, private plans. Owner, Morris Horwitz, Sixth and Girard avenue, Philadelphia. Brick, 1 story add., 6x2 6feet, 3x22 feet, slag roof, altering residence into store, extensive alterations. Contract awarded to Shectman Brothers, 1924 North Marshall street, Philadelphia.

Miscellaneous Construction News

Mausoleum, Rock Creek Cemetery, near Washington, D. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Mrs. C. I. Corby, care of architect. Contractors, Davis, Wick & Rosengarten, Washington, D. C., taking sub-bids on granite, marble, bronze, concrete, cement and excavation due as soon as possible. Plans may be seen at architect and builder's office.

Sunday School, Reynolda, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owners, Reynolda Presbyterian Church, Reynolda, N. C. (Plumbing, heating and electric reserved.) Architect taking bids due June 3rd.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Owners taking bids due June 9th at 2 P. M. Certified check required. Deposit of $2.00 for plans (not refunded).

Contract 64, Rogers Corner Cutoff, .97 mile. Excavation, borrow, broken stone base course, cement concrete pavement, concrete, corrugated metal pipe, R. C. pipe, wood shoulder curb.

Contract 66, Kennett Pike Drainage, 400 feet. Borrow, catch basins, terra cotta pipe.

Contract 67, Elliott's Crossing, .40 mile. Ex-

cavation, borrow, broken cinder base course, corrugated metal pipe.

Contract CN29, Milford X Roads-Mermaid, 3.55 miles. Excavation, borrow, sub-base, broken stone base course, cement concrete pavement, longitudinal metal joint or non-metallic joint, class A concrete, reinforcement, R. C. pipe, pipe underdrain, class A concrete gutter, wood shoulder curb.

Proposal

Addressed to the Chairman of the Building Committee, will be received by Board of Trustees, Laurelton State Village, Laurelton, Union County, Penna., until 10.30 A. M., June 12, 1926, and then and there publicly opened for the furnishing and installing of Central Heating Plant. Separate bids are to be received on the following items:

1. Building complete with retaining walls, railroad trestles, excavating and grading.
2. Boilers including settings, accessories, and smoke breeching.
3. Radial Brick Chimney and foundation.
4. Steam distribution system including piping and auxiliaries in Boiler House; underground system of piping; alteration and additions to heating and hot water systems in buildings.

Proposals will be considered only from individuals, firms or corporations possessing satisfactory financial and technical ability; equipment and organization to assure speedy completion of the contract, and in making awards, the records of bidders for expedition and satisfactory performance on contracts of similar character and magnitude will be carefully considered. Drawings and specifications may be obtained upon application to **George S. Idell, Architect, 1510 Chestnut Street, Philadelphia, Pa., for Item 1** and from **Stewart A. Jellett Company, 1200 Locust Street, Philadelphia, Pa., for Items 2, 3 and 4,** upon a deposit of $10.00 payable to Laurelton State Village, as security for safe return of the drawings and specifications within ten (10) days after date of opening proposals.

A certified check for five per cent (5%) of bid or an approved bidder's bond to the amount of five per cent (5%) of bid must accompany all proposals, as a guarantee that successful bidder will execute the contract and furnish a satisfactory surety bond in the full amount of same.

(Continued from page 324)

tween the floor joists, and a warm room underneath, the "sweating" of the ceiling will occur most frequently at the places on the ceiling, which are just under the joints between the lath. This sweating consists frequently of only microscopic patricles of moisture and it is on these little wet strips between the lath that any dust which is present will collect so that in time a definite dirt streak becomes apparent, and the location of each and every lath can be readily traced by a glance at the ceiling.

The same, however, is not true of a ceiling which is plastered on a metallic base. The metal acts as a temperature distributor so that the entire plastered surface is at practically the same temperature and if any condensation takes place, it is uniform over the surface and the streaking is absent. It is for this reason that many builders are coming to use the metallic base for their plastering because it has been found that whereas some apartments need decoration every year, others that are plastered on metal lath can go without decoration sometimes for two years or more, simply because of the absence of streaking and discoloration.

This matter of redecoration, now that labor and materials for this class of work have risen to such high figures, is manifestly one of large expense which in many cases forms an appreciable part of the income from an apartment building. The prospective builder or investor in such types of residential occupancy, can well afford to look very carefully into this matter of Better Plastering, especially when it is realized that the added cost of plastering on a metallic base in many cases runs as low as 25c per square yard.

"Using a figure of 25 cents per square yard as the difference in cost between plastering on metal lath and ordinary plastering," says E. M. Lurie, civil engineer and building construction expert for the Associated Metal Lath Manufacturers, "it will be found the added investment occasioned by using metal lath on the entire ceilings of an average six-apartment building, costing $30,000 will amount to only $160,—about one-half of one per cent of the total cost."

"Moreover," continues Mr. Lurie, "note how this small item of $160 does yoeman work in reducing upkeep costs:

"With ordinary plastering, the ceiling quickly shows the need for redecoration. Here it is that streaks and discoloration first make their appearance. When a metal lath base is used the walls and ceilings "weather" alike and except that the paper on the side walls may need a little going over once a year, the apartment may go two years without requiring the decorator's attention.

"Assuming that each apartment in this building is redecorated every year, the cost of calcimining the ceilings alone as quoted by reliable decorators would amount to $147.00. If, however, the ceilings are in good shape—unstained and undiscolored—so they require calcimining only every other year, the cost per year, will be just one-half of the above amount or $73.50. The saving of equal amount capitalized at six per cent. represents the interest on $1,225.00. Comparing this amount with the $160.00 difference in the initial cost between plastering on metal lath and ordinary plastering, it will be seen that the owner by investing in Better Plastering, saves the interest on $1,065.00 which amounts to $63.90 yearly. His $30,000 building in reality is worth $31,-065 merely because he invested $160 for Better Plastering.

Another way to look at it is to note that when the owner has had the ordinary plastered ceilings recalcimined four times, he will have paid to the decorator, out of the rentals received, an *extra* sum for the cost of upkeep just a few dollars less than the original cost of using Better Plastering; nor does this consider the probability that redecorating the ceiling may require attention to the walls thus adding materially to the maintenance expense. From a financing point of view it looks far better to place the added expense for using metal lath in the original construction contract than to show the larger fixed annual upkeep expense required for decorating and cleaning unsatisfactory plastering."

Considering also the matter of plaster cracks, as mentioned in the early part of

this article, the "American Builder" goes on to say that many a prospective renter judges the character of the building in general by the condition of the walls and ceilings. Cracks are most apt to occur in corners because it is there where different types of construction, subjected to different stresses, join; the creed for Better Plastering has been widely adopted by better builders and includes the use of strips of metallic lath to reinforce these corners. They are, undoubtedly, the least expensive item which goes in to the cost of plastering and applied over ordinary lath or plaster board, where walls and ceilings come together, the plaster is thus reinforced at its most critical point. Tests made at the Armour Institute of Technology have shown conclusively that the cracks will not form until a load much in excess of that which will produce a crack, is thrust upon the construction, inasmuch as much of the stress which causes cracks in ordinary construction, is the result of minute shrinkage of the fibres of the wood studs, which are the structural support of a wall. Therefore, as the cracks do not occur sometimes for a year after the building has been completed, it will be readily appreciated that if metal lath is used at these corners, the effect of the stresses in the wood can be counteracted so as to result in a crackless corner.

Thus, the owner of an apartment must give consideration to this very simple method of reducing the large expense caused by corner cracks. Two such cracks in opposite corners of a room may require its entire re-decoration as a cost which would vary anywhere from $10.00 to $25.00 depending on the type of decoration. The actual cost of building metal lath into the corners of a room will not amount to more than possibly $1.00 a room, so that its use can be of very material benefit to the prospective builder.

In commenting on the preceding, Mr. Lurie, who has been quoted previously states:

"In closets, bedrooms and similar parts of the building crackproof plaster on a metal base prevents the concealment of vermin, and is thus a great boon to good housekeeping. Moreover, in the larger rooms such as living and dining rooms and in the kitchen portion of kitchenette apartments where cracks are most discernible and objectionable, it will be seen by figures quoted in the preceding data, that the employment of metal lath throughout might well be given consideration. The walls and the ceilings of that part of the building used for preparing food are especially subject to mositure which causes ordinary lath to swell and warp and discoloration would be found most prominent under such conditions. Here again the question of investment necessary to offset the large item of redecorating expenses, demands careful thought."

Outside of the purely commercial advantages to the owner of an apartment building, in using Better Plastering as a means of reducing upkeep expense and maintaining the resale of his building, there is the further very important advantage of having a building which is fire-resistive to a remarkable degree. The use of metal lath as a plastering base and protection for wood studs and joists, results in what is known as "Protected Construction," which has been given a full one-hour rating by authoritative testing laboratories. Many cities and the codes of many states, now require this type of construction as a minimum protection for certain parts of apartment houses in order to insure safety of life to occupants. Such construction will confine the fire to its starting place for at least one hour thus permitting the occupants to make their escape without panic and leaves ample time for the fire department to be notified and reach the fire before it has gained headway. This type of protected construction is midway between ordinary construction with its serious fire hazard and resulting loss of life, and the much more expensive so-called fireproof construction which requires masonry walls and partitions and frequently makes the cost of apartment buildings so high that the investment involved results in high apartment rentals, which are in many cases hard to justify. They are a permanent incumbrance on the building and such apartments are at a disadvantage when compared with those of the protected type which can be built as a much lower cost.

Hotels and apartment owners frequently give large display to the fact that their building is fireproof, and for all practical purposes the owner of a building of protected construction can similarly use the fact as a decided asset in renting apartments.

There is thus a three-fold advantage in employing Better Plastering; one is the dollars and cents question of reducing maintenance costs, second the reduction in "turn-over" by preserving a new appearance in the apartments so as to encourage the tenant to remain, which fact in turn preserves the re-sale value of the building. Third, there is the added advantage of being able to say that the building affords an unusual degree of protection to the lives of its occupants.

Of unusual interest to all prospective home owners is a special pamphlet "Six Steps in Building or Buying a Home," just issued by the American Construction Council.

This pamphlet gives suggestions on the more important things which should be kept in mind when buying or building a home.

Like all of the Council's findings it is impartial in nature and designed to further the interests of the public in co-operation with the responsible elements of the construction industry.

It has been prepared by the Better Building Committee of the Council after a national survey of conditions and through this committee represents the combined effort of over 40 representatives of all branches of the construction industry including public officials.

As such this pamphlet should have unusual significance in showing prospective home owners the business value of better built and properly financed homes as well as how to get them.

Several years ago the American Construction Council called special attention to the very serious situation confronting the country because of the large percentage of present day building throughout the country, especially housing, that is distinctly inferior in quality and unsound in financing. At that time the Council pointed out that many houses recently built are so carelessly constructed that within ten years time, sometimes less, they will be practically valueless and that this means not only a heavy burden in repairs and maintenance, but serious loss on the principal invested with frequently higher insurance rates and greatly increased heating costs. It also pointed out that the methods of financing were frequently just as bad as the character of the construction itself.

To help remedy this situation the Council, as a non-profit making impartial body representing nationally all of the component parts of the construction industry, is giving vigorous attention to the whole problem of Better Building and is bringing together the public and the industry itself in the development of good standards and practices. Certainly no question is of more far-reaching scope or of greater intensity in its importance to all elements of our citizenship than this question of better building. In some fashion or other it hits everybody—investors, owners, manufacturers, designers of buildings, employers, labor, renters, payers of insurances and the like. Questions of health, safety and comfort of living also enter into it.

This pamphlet on "Six Steps in Building or Buying a Home" has been prepared for national distribution and is available at nominal prices covering the cost of printing only. The American Construction Council, whose headquarters are at 28 West 44th Street, New York City, will be glad to mail any number of copies to those who wish them upon receipt of such price, as follows:

1 copy	10c
10 copies	90c
25 copies	$2.00
50 copies	3.50
100 copies	5.00

Fatima Cigarettes Are Made In An "ANTI-HYDRO" Waterproofed Factory

The basement in the Liggett & Myers factory was *permanently* waterproofed and dampproofed in *one operation* and at one cost of less than 1 ½ cents a square foot by using "ANTI-HYDRO" in the one-inch concrete floor topping.

Large bales of tobacco, which must be kept dry to prevent rotting, are stored in this basement. They weigh from 600 to 700 pounds and are continually trucked over the concrete floor. Since "ANTI-HYDRO" both hardens and waterproofs concrete at the same time, it protects the floor from wear as well as water.

"ANTI-HYDRO" is easy and economical to use. Being a liquid integral agent it mixes readily with the gauging water without the aid of skilled labor. Twenty-two years of continuous use on every type of concrete work has made "ANTI-HYDRO" the accepted standard. Use it on your next job for *guaranteed* satisfaction.

As The Editor Sees It

NEW FINISHES FOR THE WOODWORK IN THE INTERIOR THE MODERN HOME

Woodwork for the interior of the home has been characterized in the past few years by simplicity of line and finish. Simplicity of line has been obtained by doing away with all the fancy cornices and moldings that used to be considered essential if the woodwork was to be decorative. But it happens that wood trim has been made just as interesting by conservative handling, which has minimized the actual amount of woodwork in a room. It has been a case of quality rather than quantity.

For example, the trim about doors and windows has been narrowed down to a smooth plain board, unornamented in many cases and at most, decorated with only one or two groovings. Doors have been simplified in appearance by use of one single panel rather than many small ones and the tops of bookcases, buffets and fireplaces have been given simple treatment by using a plain heavy board for shelf and mantel rather than one made elaborate with cornice and fancy molding.

Wood trim set flush with the wall has also been in favor, the baseboards being treated this way as well as the window and door trim. And this method of handling wood trim has been recommended for its hygienic aspect as well, eliminating as it does, many dust catching surfaces.

All this simplicity and almost severity of treatment harks back in a degree to the idea of giving the house an Old World atmosphere. With the styles of the early Renaissance being copied in the newer homes a certain primitiveness, a certain rough craftsmanship has been considered one of the desirables notes in decorating the rooms, be they living, dining, or bedrooms. And from this simplicity there has grown a still newer tendency to bring out the woodwork by new features.

The new features mean the addition of balustrades and grilles between rooms as a filler or curtain on each side of door openings, before wall recesses and windows. Shelves have grown in popularity too, bracketed on the wall, walls themselves have been made a part of the wood-trim by panelling and wainscoting, and ceilings are being timbered wholly or partially. Timbers, hand-hewn, were seen recently for ceiling trim in one attractive house and the stairway in this same dwelling was made pleasingly quaint by hand-turned balustrades and unusually heavy treads left in dull finish. To further carry out this rough craftsmanship, heavy nail heads are frequently employed and the wood is usually left to show its grain through a very dull polish. Carving is also a means of giving added beauty to woodwork suggesting the art of the Old World, and in many cases, a clever painting of the wood simulates the carving at far less expense.

Of course, the treatment of wood given a room depends largely upon the effect desired and this in turn depends upon the selection of wood that will carry out the chosen style pleasingly. A natural finish for wood is very good for such rooms as the hall, living and dining rooms. Walnut and mahogany, the genuine or an imitation finish, are popular and gum is also used to good advantage. Redwood is also very handsome when left in its natural tone, but rubbed to a satin smoothness.

Color is coming to the front too, in featuring the woodwork and there is a bewildering choice of colors and fancy finishes from which to choose, if gayety is liked for the interior of the house. The narrow wood trim that is simple in line, according to the latest fads, is demanding a bright color coat or a trimming of color here and there. Besides the standard creams, whites and grays, there are several other colors coming into favor such as green, blue and brown. Green is delightful in an apple tint or a dull blue green and blue may range from a dull gray blue to a deep royal blue. Brown is seen in coffee tint as well as a deeper brown and is used for the formal rooms of the house as are the other new greens and blues.

For bedrooms, lavender or a gray that suggests lavender, blue, rose and yellow are seen. Pink woodwork is indeed very pretty in some settings and was seen in one new home given a plaster treatment to blend it with rose walls. For the cottage chamber, these new colors recommend themselves especially and are most charming when chosen with an eye to the exposure of the room, as for example, with blue, a cool color, on the sunny side of the house and yellow or sun tint used for a cold north room.

For novelty, black and scarlet is also being used in such rooms as the breakfast and sun-rooms. Scarlet is best used scantily, however, and black is best livened with another color such as orange, red, light green or gold.

Two-toned effects are indeed the means of making woodwork very smart and distinctive. In a dining room painted in dull gray, the woodwork may be brightened by a line of bright green or blue, for example, used to edge the trim, and about panels on the doors. Orange on deep brown is another delightful combination and yellow with deep blue may give the woodwork a pleasing richness.

Decorative motifs are also being used to brighten up panels where walls are wainscoted, and doors are "shadowed" so that panels are a feature now. Flowers in quaint bouquets furnish the inspiration for some of the decorations and scrolls of silver and gold are good.

The use of gold and silver leads one to consider still another means of treating the wood-trim of the house. Metallized effects are among the newest of finishes for woodwork. Stippled and polychromed are many of the door and window frames, the base boards and moldings. Very often a plain color such as blue or green is covered with a spray of silver or gold to give a polychromed effect. And wiped woodwork is still another means to be employed when wishing to bring out the grain of woodwork and yet have a number of colors suggested. Gray and green in a soft blend, for instance, are achieved by using some of these new treatments in such rooms as the living or dining room and may suggest a welcome change from the much used ivory or plain gray.

In any case, a study of the new styles in wood-trim and finish will help one to modernize the old house and have "the latest" in the new house, with a wide variety of styles and an equally accommodating scale of costs dependent on simple or elaborte treatments, one may make the woodwork of the home as individual as one likes!—Keith's Magazine.

The Concrete Waterproof Paint Company, 829-35 North Third Street, Philadelphia, the only manufacturers of Waterproofing in Philadelphia, are now applying their own products—the various types of waterproofing, dampproofing and cement coating—so as to assure their clientele satisfactory work.

Among the jobs recently completed by the Concrete Waterproof Paint Company are: The Liberty Title & Trust Company, The Rittenhouse Plaza, office building for the Gulf Refining Company, The Philadelphia Paper Bag Company and Hardwick & Magee.

WORLD FAMOUS STRUCTURES

THE HOUSES OF PARLIAMENT, LONDON, ENGLAND.

THE VAN SCIVER CORPORATION · V · SERVICE

THE NEW palace of Westminster was built during the period 1840-1867, at a cost of nearly $15,000,000.

It was designed by Barry, for the Houses of Parliament, and constructed on the site of the old palace, which was destroyed by fire in 1835.

It is a vast and ornate building in the Tudor-Gothic style, covering an area of about eight acres.

"ANTI-HYDRO" Keeps Springs of Water Out of This Building

There are two underground springs under this building but the basement is always dry because the concrete foundation is permanently waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" waterproofs concrete against any head of water; it also hardens it in the same operation.

Being a liquid integral compound, "ANTI-HYDRO" mixes easily with the gauging water without the aid of skilled labor. It also accelerates the set of cement without weakening it and eliminates finishers' overtime work.

For 22 years "ANTI-HYDRO" has been successfully used on every kind of concrete hardening and waterproofing work. Use it on your next job for permanence.

BRICK

DID YOU EVER

get a car of face brick which ran better than the sample?

That's what we try to give you because it makes it so much easier to get your next order.

Our sources of supply are behind us in this policy. They don't have to "short count" us or ship number twos because we pay them a fair price for their brick, and then we pay them promptly too.

As The Editor Sees It

STRENGTH OF MASONRY AT EARLY AGES

BY J. S. ELWELL,
Manager, Construction Department,
National Lime Association

Presented before the Building Officials' Conference, April 28th, 1926,
Columbus, Ohio.

Building officials, perhaps even more than any other group of men connected with construction, are interested in the early strength of masonry. There is an abundance of data showing how strong structures will be after a month or a year has passed, but until recently there has been very little information as to the strength of walls during the construction period.

The safety of our families is to a large measure in the hands of our building officials. To them is entrusted the task of reviewing and passing upon the designs for structures which will house our families and our businesses. They must make sure that the structure has sufficient strength to carry the loads during, as well as after, construction, as well as to see that reasonable precautions against fire are exercised.

Also, this group of men are in a large measure guardians of our pocket books. It might be possible to prepare a code which would make every structure safe against fire and storm, exceptionally severe loads, etc., etc., but this would only be possible under excessive costs, and as a result construction would come to a standstill and industry would be seriously handicapped. However, you gentlemen have within your power the right to permit economical construction, always seeing to it that such structures are safe.

Mortar enters into every type of construction to a greater or less degree. It may be used only in foundation walls, or in curtain walls which carry little if any load, or it may be the tie that binds the whole frame of a structure together. Consequently, data on masonry strength is vital.

A series of tests was recently completed at the Rock Island Arsenal, Col. D. M. King, Commanding, on the strength of wall specimens laid up in lime mortar. These tests, which were made by P. C. Cunnick, Director of the Laboratories there, were conducted at the ages of 1, 2, 3, 4, 5, 6, 7 and 28 days on specimens 8 inches thick, 16 inches long (4 headers) and 36 inches high (13 courses), and supplementary tests were also made on 2 and 3 brick specimens. The data secured is most interesting. All specimens were laid up with 3/8 inch mortar joints, all joints full, by the Arsenal bricklayers under the immediate supervision of the foreman, Mr. Foley, and represent good average practice. Clay brick, classed as "hard" under the A. S. T. M. requirements, were used throughout. Three types of 1:3 mortar were used.

In one group of tests the mortar was made from hydrated lime and sand mixed just before use, as might frequently be the case in the field. The other two mortars were made from lime putty and sand, the difference being that in one group the putty had been allowed to age for 3 days and in the other the ageing period was 14 days. All materials were obtained on the open market.

In order to determine how much settlement would occur under loads at these early ages a series of readings were taken on each specimen, the measurements being taken to 1/1000 of an inch and the loads which produced these deflections noted. The results are shown in Table I.

TABLE I.

Loads Producing Given Deformations

8x16x36″ Wallettes

1:3 Lime Mortar

Mortar made from	Deformations of Wall per ft. of height	Average Load in Lbs. per Sq. In. age of Wallettes at Test							
		1	2	3	4	5	6	7	28
Hydrated	1/64″	33	30	40	40	50	40	55	105
Lime—	1/32″	75	60	75	75	90	80	98	180
Not Aged	1/16″	182	145	180	180	210	185	225	367
Lime Putty	1/64″	38						50	92
Aged—	1/32″	72						97	172
14 Days	1/16″	167						210	345
Lime Putty	1/64″	25	25	25	30	30	30	37	92
Aged—	1/32″	47	50	45	55	50	50	67	172
3 Days	1/16″	105	110	95	110	130	105	145	335

Loads recorded under 1, 7 and 28 days—6 specimens; 2, 3, 4, 5, 6 are 3 specimens

It will be seen that even at the age of 1 day it would require far greater loads than could be imposed on a wall to produce a settlement which could be noted. For quick computations, it is safe to say that each foot of wall produces a load of one pound per square inch. For example, to compress an 8″ wall 1 ft. high and 1 day old 1/64″ would require the erection of 30 ft. of wall during the next day. If the wall at the end of a day's work was 5 ft. high, it would require 6 ft. more wall laid up during the next day to produce a settlement of 1/64″ or 12 ft. more to show 1/32″ settlement.

These figures are of more theoretical than practical interest, for a grain of sand passing a 50 mesh screen is big enough to more than compensate for such a settlement and the ordinary mason's trowel is a full sixteenth of an inch thick. It would, therefore, be impossible to measure wall settlement on a regular piece of masonry construction, even when the walls are being rushed up. Considerably greater loads would be required to produce settlement in the wall if the loading was delayed even another day or two.

Inasmuch as factors other than pure compression enter into wall strength, tests of the shear strength of specimens laid up in these several mortars were also made. The specimens consisted of three bricks bonded together with two ordinary mortar joints. They were tested in the vertical position with the two outer brick supported on knife edges 3½″ apart and the load applied to the center brick through a spherical bearing block as specified by the A. S. T. M.

In these tests, as in the compression tests, the strength of the specimen increased with age, but even at the very early ages sufficient strength is developed to resist all ordinary forces. For example, at one day a single brick surrounded by mortar on 2 sides and 2 ends would have a resistance to displacement of 250 lbs. if laid in mortar made from hydrated lime; while at 28 days it would require a uniform pressure of 72.8 lbs. per sq. in. on the exposed face of a standard brick in a 4″ wall to force it loose.

Table II shows that at the age of one month these "wallettes" have a compressive resistance of nearly 800 lbs. per sq. in. Some time ago the U. S. Bureau of Standards ran a series of compressive strength tests on sand-lime brick walls, using both large sized specimens and "wallettes." These tests are reported in

(Continued from page 356)

Technologic Paper 276, "Compressive Strength of Sand-Lime Brick Walls." The investigators found that the strength of the large specimens was from 60 to 80% of that of the small specimens or "wallettes."

LOADING ON PARTY WALL
20' SPAN BOTH SIDES

Height Stories Plus Roof	Feet	Wall Thickness Inches	Weight of Wall per Linear Foot	Live and Dead Load per Foot	Total Load per Linear Foot	Load on Lowest Mortar Bed, Lbs. per Sq. In.
1	10	8	800	4,000	4,800	50
2	20	8	1,600	6,000	7,600	80
3	30	12	2,800	8,000	10,800	75
4	40	12	4,000	10,000	14,000	97
5	50	16	5,600	12,000	17,600	92
6	60	16	7,200	14,000	21,200	110
7	70	20	9,200	16,000	25,200	105
8	80	20	11,200	18,000	29,200	122
9	90	24	13,600	20,000	33,600	117
10	100	24	16,000	22,000	38,000	132

TABLE II.
28 Days Strength of Wallettes

1:3 Mortar made from	Average* Maximum load lbs.	Average* Maximum Strens. lbs per sq. in.
Hydrate, Not aged	102,000	793
Lime putty, aged 14 days	103,250	778
Lime putty, aged 3 days	65,750	514

On this basis it will be seen that the factor of safety of masonry laid up in lime mortar is high. Under ordinary conditions the U. S. Building Code Committee in their report on Minimum Requirements for Masonry Wall Construction, permits a loading of 90 lbs. per sq. in. when 1:3 lime mortar is used. Assuming that the loading equals this figure, which actually is rarely reached, the factor of safety as calculated from the 28 day results here presented may be taken as 6 when 14 day putty or hydrate is used, or 4 when the putty has been aged only 3 days.

Not only is the factor of safety sufficient when using code limits for design, but when the actual load is computed it will usually be found far below the code limit, thus raising the factor of safety several times. For example, take an ordinary city row house with a party wall. Ordinarily the live load will be 40 lbs. per sq. ft. for floors and roof, with a dead load of 60 lbs. per sq. ft. The unsupported loaded span may be considered as being 20 ft. The brickwork

may be figured as weighing 120 lbs. per cu. ft. Using these figures it will be seen that the masonry stresses in an ordinary 3 story structure are well within the limit of 90 lbs. per sq. in. When stresses are computed, however, the U. S. Code Committee permits an increase of 50%, raising the load on lime mortar to 135 lbs. per sq. in. Under that limit, structures of the type just referred to could be carried up to 10 stories before the limit is reached. However, the wall space required would govern before the load limit was reached and steel or concrete frame construction would be used.

Lime mortar has been used for centuries in all types of masonry work and its durability has been established by the test of time. Its fire resistance has been tested and found satisfactory, its strength is more than sufficient for all ordinary wall loads, and its economy is apparent.

Where high and concentrated loads are encountered cement may be added to lime mortar. Such a practice will increase the strength of the mortar, although it also increases both the labor and material costs. These factors should all be taken into consideration when specifying types of mortar.

A series of tests to determine the effect of low temperatures on various types of mortars was recently reported by the University of Wisconsin. They found that a mix composed of 1 part cement, 2 parts lime and 9 parts sand by volume combined the three desirable functions of ample strength, resistance to damage by low temperatures, and economy. This mortar is easy working and easy to proportion, both of which are important on the job.

Mortar should be used just as steel, concrete, wood, or other structural materials are used. In other words, it should be specified with due regard to the load which it must carry. There is no more reason to require a built up steel girder as a door lintel in a bungalow than there is to specify a rich cement mortar in one story building or in a curtain wall, for in both cases strength would be wasted and economy sacrificed.

The National Lime Association is constantly studying construction problems in the field and in the laboratory and is willing at all times to co-operate with building officials and code committees as well as engineers, architects, and contractors, toward the end of making possible efficient, economical and safe construction.

MORE THAN HALF THE URBAN POPULATION OF THE UNITED STATES LIVE IN ZONED CITIES AND TOWNS

More than half the urban population of the United States live in zoned cities and towns at present against about one-tenth in 1916, according to information obtained by the Division of Building and Housing of the Department of Commerce. There are now 436 muncipalities with a population exceeding 27,500,000 inhabitants that have zoning ordinances in effect, as against six cities with less than six millions in 1916.

The greatest development of zoning has taken place practically within the last ten years. The number of zoned cities increased from six at the end of 1916 to 73 by the end of 1921; to 265 by the end of 1923; to 425 by the end of 1925; and 11 additional places have reported zoning ordinances adopted since the first of the year.

Grouped according to population, 47 of the 68 largest cities having over 100,000 population, and 150 of the 287 cities and towns having over 25,000 population have zoning ordinances in effect.

In an effort to protect home owners, and other land owners, in the reasonable use of their property, these cities, towns and villages adopted zoning ordinances, according to Dr. John M. Gries, Chief of the Division of Building and Housing. He said that "zoning seeks so to regulate the use to which buildings may be put, the area of the lot that may be covered and the height of buildings in different sections of the city, so that the land in each district may be used for the purposes it is best suited." Provision is made, consequently, in properly drawn ordinances, to secure a neighborhood of small houses, for example, against having a noisy factory site in its midst, with resulting losses not only in property values but also in peace and quiet. The factory owner, likewise, is apt to have the better choice of desirable level plant sites with good transportation facilities.

The number of zoned municipalities in the leading states follow:

New Jersey	73
New York	72
California	47
Massachusetts	41
Illinois	38
Ohio	24
Pennsylvania	24
Wisconsin	18
Michigan	16
Indiana	13
Connecticut	7
Iowa	7
Kansas	6
Rhode Island	5
OTHER STATES	45

REAFFIRM SIMPLIFIED SIZES FOR PAVING BRICKS

The permanent standing committee representing paving brick manufacturers, state highway officials, municipal authorities, federal public roads authorities and others, in its fifth revision conference held in the Department of Commerce recently, reaffirmed its action of a year ago, and the four "recognized sizes" as listed in Simplified Practice Recommendation for that industry remain unchanged.

This decision was taken after the National Paving Brick Manufacturers Association, through its secretary, Edward E. Duff, Jr., had reported that 74.2 per cent of the entire production of the country in paving brick during 1925 was in these four sizes. The figures presented represented total shipments of 353,588,777 bricks and that this covered all but 4 per cent of the total tonnage of the companies.

A decline of some 45,000,000 in shipments during 1925 over 1924 was accounted for in the report by freight charges which preclude long haul shipments to communities which formerly used vitrified paving brick extensively, and to the fact that many communities are catching up with paving requirements which arose during the World War. It was also shown that the merger of five companies had reduced the number of plants reporting. Fourteen states were represented in the survey.

Reports were received from the Bureau of Public Roads of tests of different sizes of paving brick which have been under way for some months at an experimental track at Arlington. These showed some 40,000 trips made over 10 sections paved with brick of varying thicknesses, the tests involving the use of 3-ton, 5-ton and 7½-ton trucks, fully loaded. The figures presented were received with keen interest by the committee, which later visited the test roadway at Arlington.

Discussion of whether the committee should reinstate a size previously eliminated and which had shown a marked increase in demand during the last year, led to a decision not to take this action now. The Committee was guided by a rule which was adopted three years ago and which provided that unless one of the non-recognized sizes showed a demand of 5 per cent or more for three years in succession, the reinstatement should not take place.

The personnel of the committee includes the following:

E. J. Mehren, Chairman of the McGraw Hill Co., New York City; P. St. J. Wilson, Bureau of Public Roads, Department of Agriculture; Col. R. Keith Compton, American Society of Civil Engineers, Richmond, Va.; Geo. F. Fisk, American Society for Municipal Improvements, Buffalo, N. Y.; O. W. Renkert, American Ceramic Society, Columbus, Ohio; Edward E. Duff, Jr., Secretary, National Paving Brick Manufacturers Assn., Cleveland, Ohio; Prof. T. R. Lawson, American Society for Testing Materials, Philadelphia, Pa.; Paul E. Holden, Chamber of Commerce of the United States; P. H. Bates, U. S. Bureau of Standards; G. F. Schlesinger, American Association of State Highway Officials, Columbus, Ohio; and R. M. Hudson, Division of Simplified Practice, Department of Commerce.

"ANTI-HYDRO" Keeps Springs of Water Out of This Building

There are two underground springs under this building but the basement is always dry because the concrete foundation is permanently waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" waterproofs concrete against any head of water; it also hardens it in the same operation.

Being a liquid integral compound, "ANTI-HYDRO" mixes easily with the gauging water without the aid of skilled labor. It also accelerates the set of cement without weakening it and eliminates finishers' overtime work.

For 22 years "ANTI-HYDRO" has been successfully used on every kind of concrete hardening and waterproofing work. Use it on your next job for permanence.

As The Editor Sees It

SEMI-ANNUAL STATEMENT BY AMERICAN CONSTRUCTION COUNCIL

In its national survey of construction conditions just made the American Construction Council notes the following findings:

Although the first four months of 1926 showed the greatest volume of building construction yet seen for the same period of any year and exceeds by 20 per cent the similar period for 1925, which itself was a record breaking building year, this condition is not uniform as some localities show a recession, and there are some indications toward greater moderation. The last part of April showed a slight seasonal decrease from the rate of the preceding months, which, however, is partially due to the fact that spring work has come into the market earlier than usual this year as a result of the continuous campaign for all year round work carried on by the Council and its affiliated branches of the industry as well as by the government.

It is difficult to tell whether the growth of new industrial and commercial buildings will continue to go down on the books the next six months as fast as it has during the past year. A distinct note of caution has been sounded by many individuals and many groups. In the matter of high-priced apartments and hotels a similar note of caution has been sounded. It is only in the group of medium priced well-built private dwellings that the demand seems to warrant real optimism. This demand for homes must not be confused with artificial real estate booms.

What is needed as to volume of construction is of course steady all-year-round and year-in-and-year-out out work on a sound level, and whatever can be done to maintain this is much more important than mere peak production. In addition to what is being done by the industry itself, the efforts of the Federal Government as well as of various states toward this end in the scheduling of public building programs is highly commendable.

The outstanding need still remains that of suitable housing for persons of average means at a fair price. What the Council pointed out last Fall still holds true—that the large volume of building construction has not yet met the country's real housing need! City residential construction continues in the main to be of the larger and higher priced apartments and hotels, and the more active suburban home developments are still too frequently high in price or inferior in quality.

The construction of large buildings is reflecting more and more, however, the increased demand of the public for better built buildings as urged by the Council for the past several years, and a similar demand is beginning to show itself on the part of the prospective home owner of moderate means as evidenced by the nation-wide demand for the Council's recent pamphlet, "Six Steps in Building or Buying a Home," which has received the hearty approval of the responsible elements of the various branches of the construction industry as well as of the public. But further awakening of the public consciousness to the value of better building and an ever present insistence on the part of the home buyer that he get real value for his money are still needed.

The Council urges the prospective home owner to deal only with reliable persons in all the states of buying or building a home—location, financing, design and building. He should also insist upon first-class materials and first-class workman-

ship both in the structure proper and in its equipment.

Likewise, the investing public whose money goes into mortgage bonds and other present day forms of financing large building construction should insist upon first-class construction in both materials and workmanship on all buildings into which it puts its money and deal only with reliable loaning institutions from whom it can obtain full facts as to not only the nature of the security, but the character of the building and supervision of the structure itself. In doing this the public must consider every building as a separate and distinct problem, for the safety of building loans cannot be characterized as a whole either safe or unsafe.

As the Council noted in its statement last Fall, the passing of the acute building shortage and temporary building booms in some localities with the consequent return to normal consideration of building values will make structures of inferior quality an increasingly heavy liability.

It is such insistence on the part of the public that the essentials of right construction be put into actual practice—from financing of the project and the design and erection of the building to the supervision of the finished structure—that will maintain the building industry on a healthy basis. To make this insistence effective the public must co-operate with persons of skill, vision and responsibility in all branches of the industry.

Regional planning of large and small cities as to both beauty and ultility as well as the proper development of smaller centers and suburban districts should have the hearty support of the public. Even the smaller towns and villages which anticipate future growth should conduct intelligent town planning. The flow of traffic to and from the large centers and its relation to building development is also becoming an increasingly serious problem and should receive careful consideration in this connection.

The market for building materials continues in general to be satisfactory, although in some branches of the industry a disposition to buy only for immediate requirement is seen.

Labor productivity continues to be relatively favorable which helps to reduce actual costs, although wages have advanced in some instances. Any increases in wages will, it is hoped, carry a corresponding increase in skill and proper productivity.

Money for building purposes continues to be readily available in most locations, but the element of caution is playing a greater and greater part in regard to speculative building operations.

The outlook for highway construction indicates the largest yearly volume in that branch of the industry yet seen. The Council therefore urges the public to insist that its representatives who have charge of such construction be instructed and given the necessary authority to conduct their program so as to make for more and better highways of first-class construction. Otherwise the utility of the highways will soon decline and the taxpayers of the country will in a few years be called upon to duplicate this large expenditure of public money which if wisely spent is a great national asset, but if poorly spent becomes only an increasing economic burden.

FACE BRICK MEN ORGANIZED

At a meeting held recently at the Manufacturers' Club, the principal face brick dealers and manufacturers of Philadelphia met for the purpose of forming an organization, the objects of which will be to promote fellowship and good-will among its members, advance the status of the industry, promoting use of brick as a building unit and obtain and tabulate information relative to the industry in Philadelphia, particularly as applies to face brick.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

The other firms represented in this organization were: Hydraulic Press Brick Company, A. S. Reid & Company, Wilkes-Barre Clay Products Company, Cambria Clay Company.

THERE IS NO SUBSTITUTE*

By J. S. Elwell†

Lime is indispensable in construction. It has always been used, it is used today, and will be used whenever and wherever permanent and economical building is done. Its construction uses fall into the four main classes of stucco, plaster, mortar and concrete, in each of which special advantages are noted. Stucco, which is fundamentally a covering to concealing and protecting other construction, must be composed of material which will withstand all weather conditions. That lime stucco meets all these conditions has been demonstrated in all sections of the world and in all ages. Lime stucco is not only durable but is economical. It may be finished in any desired texture or color and the ease with which it works makes possible uniformity in the appearance of the finished coat.

No use of lime is more important than interior plaster. It has been proven in the laboratory and in the field as well that lime plaster protects metal from corrosion, is a fire retardant, and is the most efficient for sound insulation. Lime mortar was the first mineral binder used by man when he started to build and has continued through the centuries as the best mortar material. Its durability is established, its strength is greater than is required under the types of construction now in common use, its economy is great, and its plasticity is necessary.

Lime plays an important part in good concrete construction in which it acts as a lubricant, facilitating placing and at the same time preventing segregation. It makes the concrete permanently watertight. In the field it makes possible the use of less water in mixing structural concrete and as is well known this reduction in mixing water increases the strength of the concrete. Concrete containing lime is more uniform in the forms than concrete without. The stresses induced by variations in the moisture content of hardened concrete are materially reduced when lime is added, and a smoother, more uniform, and lighter colored surface is obtained.

*Abstract of paper delivered at Eighth Annual Convention N. L. A., French Lick Springs, Indiana, June 8-11, 1926.

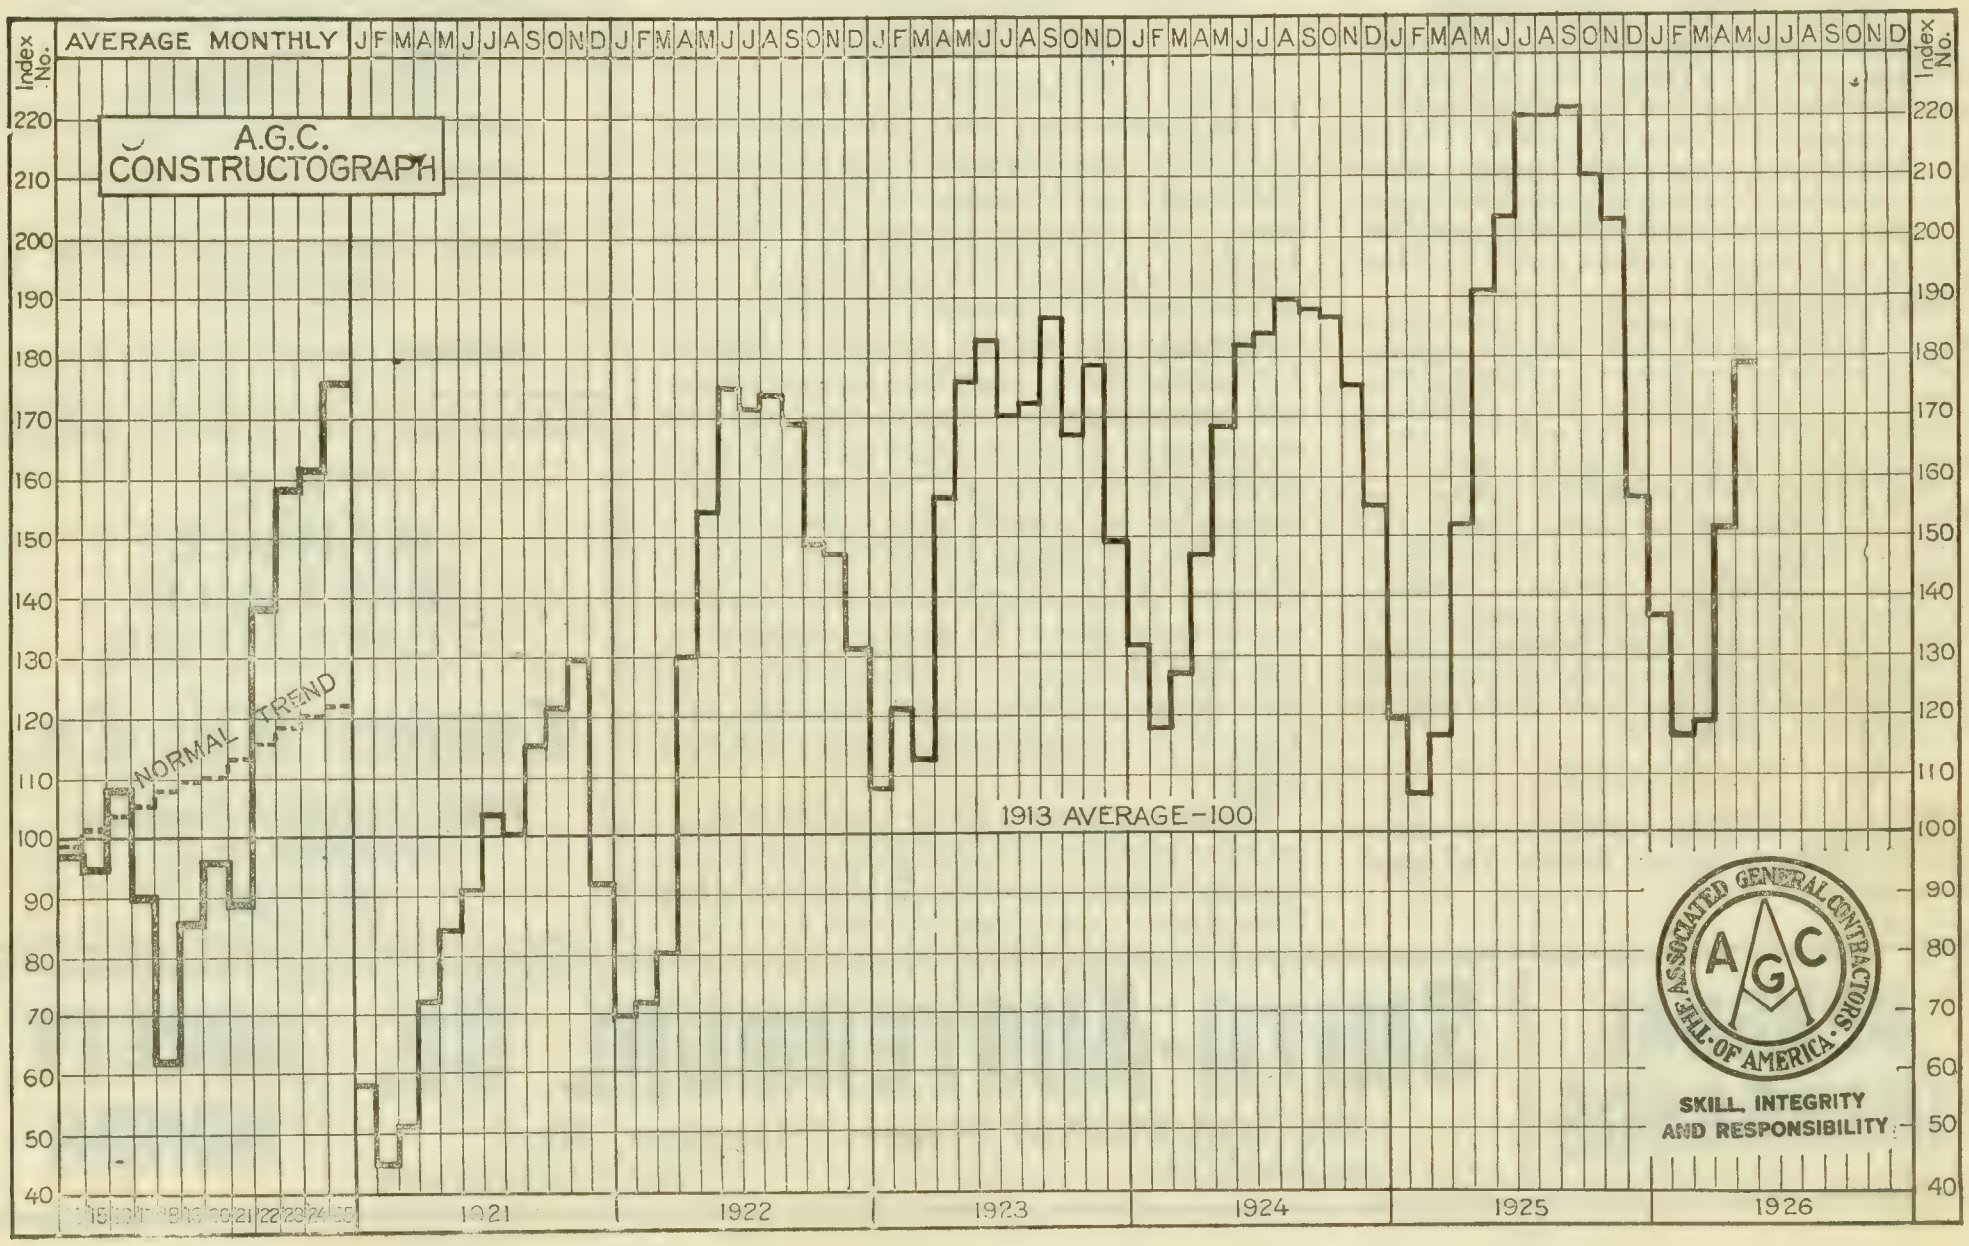
Making wood difficult for rot fungi to live in is one service to the cause of forestry within the power of the ordinary householder, according to a statement made by Aldo Leopold, associate director of the U. S. Forest Products Laboratory.

Every year, according to Mr. Leopold, a quantity of wood equal to two-thirds of the annual growth on all our forests or about 4 billion cubic feet is used to replace wood destroyed by decay in service. "This loss," says Mr. Leopold, "not only includes such items as telephone poles, and railroad ties, but also takes in the ravages of decay in wooden steps, sills, porches and other parts of frame buildings which are the concern of the home owner.

"The worst error in wood construction so far as decay is concerned is to place wood in contact with the soil. The soil not only provides a practically continuous supply of moisture for fungi, but it usually will infect the wood directly by contact with fungi already growing in the organic matter in the top dirt.

"Frequently porch columns which are well painted and in what appears to be well ventilated places develop decay at the base. The reason is most apt to be found in water seeping in under the foot of the column and remaining to support the growth of fungi. If wood which is subject to wetting outdoors is placed so that all mositure drains off quickly and so that it is open to the drying effect or circulating air, decay is not likely to develop. Decay fungi, like humans, live on air, water, and food, wood in the case of fungi being the food. Obviously, the only element which can be kept away from them to any effective degree is moisture.

"The man who never gets into the forests may not be able to see clearly how he can help combat forest fires, the arch-enemy of growing trees. He can, however, help reduce a waste of timber comparable to that from forest fires," Mr. Leopold concluded, "by fighting decay on his own front porch."



If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

Washington, June 15.—Briskness of construction activities during May resulted in an increase of 18 per cent. over the volume of work registered for April, according to statistics compiled by the Associated General Contractors of America. The amount of construction performed during the first five months of 1926 exceeds the total for the corresponding portion of last year, the comparative figures show.

Construction costs rose during May to the highest position they have reached since July, 1925. The increase, coming despite the fact that prices of construction materials dropped appreciably during the month, reflected wage advances. Wages in the construction industry last month reached the highest average they have held since 1920, an increase of 2 points placing them at an index number of 228, based on the 1913 figure.

The volume of contracts awarded during the first months of this year exceeds by 16 per cent. the volume registered by the corresponding period last year. Figures on building permits issued since the first of the year are practically equal to those covering the same period of 1925. The totals on contract awards and permits issued in April were slightly lower than the corresponding figures for April, 1925.

The average of prices paid for construction materials was lower last month than in May of any year since 1922. Drops in prices of cement and common brick in some sections were responsible for continuance of the decline, which has been steady since June, 1923.

Concrete Pits Waterproofed With "ANTI-HYDRO" are Always Dry

The concrete pits in this building, as well as the tunnel under the railroad, are waterproofed with "ANTI-HYDRO". Both pits and tunnels are always dry.

"ANTI-HYDRO" permanently waterproofs concrete against any head of water. It also hardens concrete and makes it acid, alkali and oil resisting all in one operation. Easy and economical to use, because it is a liquid integral compound, which mixes readily with the gauging water without the aid of skilled labor.

Some "ANTI-HYDRO" jobs are 22 years old, yet they look like new. That's because "ANTI-HYDRO" results are permanent. Use it on your next job for guaranteed satisfaction.

PROPER METHODS OF CONSTRUCTING ASPHALT TENNIS COURTS

By W. E. Rosengarten, *Engineer, The Asphalt Association, New York, N. Y.*

Interest in lawn tennis has been increasing in recent years and with it there has developed a strong desire for more nearly perfect court surfaces. The qualities which are sought are greater smoothness than can usually be retained in the ordinary sand clay tennis court, and greater firmness and resiliency. Paved surfaces, particularly those of asphalt, permit of fast and true play without serious fatigue or injurious effect upon the players. An important consideration from the standpoint of ultimate economy is the construction of a surface that can be kept in perfect condition at small labor and expense throughout the playing season.

Of the many thousand of tennis courts that exist throughout the United States only about 10% have been given hard, smooth, paved surfaces and the trend toward the best in tennis courts is, I believe, therefore, only in its initial stages. The most satisfactory results thus far obtained in modern playing surfaces are with some form of construction either of asphalt, sand and stone mixtures or macadam bound with asphalt and constructed similarly to the paving on our streets and highways. England has made extensive progress in this direction and has not only reached a high degree of efficiency in constructing and maintaining asphalt tennis courts but has obtained some very beautiful effects by incorpating into the finished surface red crushed tile, or treating it with a green solution, thus presenting a very pleasing color scheme either contrasting or harmonizing as desired, with the borders and terraces of green turf.

While there are asphalt paved courts located at Detroit, Michigan; South Bend, Indiana; Calgary, Canada, and other points, they are most common in the Pacific Coast section of the country. Their general use there is due largely to the fact that in California is obtained an abundance of petroleum which yields asphalt, a popular and readily available local product. Because of the greatly increased use of asphalt for paving and roofing within the past few years and the establishment of asphalt plants at convenient points, sources of supply and competent construction facilities for asphalt courts are now within easy reach of any community. While the greater portion of the asphalt supply in the United States is obtained from Mexico, petroleum asphalt is also obtained from the Middle West, Southwest and the Pacifist Coast and Rocky Mountain sections.

Asphaltic tennis court surfaces are waterproof and, in consequence, not only are the courts available for play within ten or fifteen minutes after a rain but the surface is thoroughly protected against washing or disintegration such as are frequently caused by heavy downpours on sand, clay or earth courts. A maximum smoothness is obtainable in the asphalt playing surface and this smoothness is retained throughout the play on account of the fact that the powerful adhesive character of the asphalt prevents any displacement of the surface material. Asphalt is a flexible and resilient material and makes possible long and continuous periods of play without tending to tire out or stiffen the players. The freedom of the surface from sharp, angular fragments or from rigid, gritty texture tends to conserve the soles of the

players' shoes as well as the tennis balls, since there is practically no abrasion.

While the original cost of an asphalt court is somewhat greater than a sand clay or gravel court, the initial cost is retrieved in a very short time because a properly constructed asphalt tennis court requires practically no upkeep.

Methods of Construction

Proper drainage is of primary importance for an asphalt tennis court just as it is in the proper construction of a highway. In sandy or gravelly soil the drainage problem is not serious and the water drains away easily and naturally. Soils in which clay predominates, however, will retain water and unless proper drainage facilities are provided the west subgrade under the surface will not provide sufficient support for the pavement. Where such a soil is encountered drainage is obtained by digging a ditch two or three feet deep along each side of the court and giving to these ditches a slight grade or fall in the direction of the general slope of the ground. In the bottom of these ditches there should be laid a small-sized, open-joint tile after which the trenches should be back-filled with broken stone to within a few inches of the surface. This drainage system will collect the ground water and lead it away from the subgrade. Drainage of surface water from the court itself will be obtained by giving the finished surface a slight slope of one inch for each ten feet of distance.

In the construction of the tennis court the subgrade should be leveled and finished to an elevation such that when the playing surface is applied the latter will be flush with the shoulders or the surrounding sod, thus permitting an uninterrupted drainage of surface water after the court is completed. Where fills are made they should be thoroughly compacted and allowed to stand until they have been subjected to several heavy rain falls before surfacing is attempted. The paved area of a tennis court should be 60x120. As the outside dimensions of a double playing court are 36x78 feet, such a paved area will afford ample room for play outside of the lines.

After the grading and drainage work has been completed and the subgrade is dry and compacted, a foundation course of steam cinders of from 4 inches to 6 inches in thickness may be applied to good advantage. Ashes from house furnaces are not desirable for this purpose. The cinders should be thoroughly compacted by sprinkling with water and rolling. Too much stress cannot be laid upon the importance of a thoroughly rolling since it constitutes insurance against trouble later from the settlement of the paved area. Equal, if not better, foundations can be obtained through the use of crushed stone, gravel, slag or similar local materials, or from a three inch bed of portland cement concrete. A superior type of foundation may be laid if an asphalt paving plant is accessible by laying a mixture of stone and sand bound together with asphalt according to up-to-date paving specifications and at a thickness of about two and one-half inches.

As suitable a type of surface course as can then be laid upon the foundation is the sheet asphalt pavement similar to that which is commonly laid on great thoroughfares like Fifth Avenue, New York . This consists of a mixture of hot sand, limestone dist and asphalt cement, and should be laid to a thickness of from 1 inch to 1½ inches. This material should be prepared at a mixing plant. Asphalt paving contractors are, of course, quite familiar with this type of construction and complete information can be obtained from them as well as the local engineer in charge of city, street or country highway paving.

Where the base course is of broken stone or cinders, it will be desirable first to lay what is known as a binder course about 1 inch in thickness upon the found-

Somerset County, R-50, A-3680, Addison Township. One course reinforced concrete. $160,087.70. Contract awarded to Tri-State Eng. Co., Cumberland, Md.

New Jersey Construction News

School (High), Gloucester, N. J., $271,000. Architect, Edwards and Green, 548 Federal street, Camden, N. J. Owners, Gloucester School Board, C. A. Fowler, Chairman, Gloucester, N. J. Fireproof, 3 stories. Architects selected.

Office Building, Asbury Park, N. J. Engineer and Architect, F. D. Shea, 279 N. Michigan ave., Chicago, Ill. Owner, Utilities Power and Light Company, Asbury Park, N. J. Brick, cut stone, granite, steel, 10 stories and basement, 113x60 feet, composition roof, cement floors, hollow tile, elevators, plumbing, shoring, waterproofing and campproofing, ornamental iron work, iron stairs, bond, hollow metal doors, hollow metal sash, terrazlo work, metal lath, electric light, steam heat, ventilating, bronze work, metal toilet stalls. (Plumbing, heating, electric and ventilating, elevators, toilet accessories, steel stack, sidewalk lift, separate bids). Architect taking bids due June 24th.

Residence and Garage, Ventnor, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owner, George Burke, care of architect. Brick, hollow tile and stucco, 2 stories and basement, 42x56 feet, hardwood floors, electric light, tile work. Plans in progress.

Hebrew School, Trenton, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, Dr. Heizl, care of architect. Stone. Preliminary plans in progress.

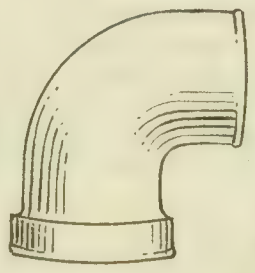
Greenhouse and Warehouse, East Front street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, M. C. Ribsam & Sons Co., Broad and Front streets, Trenton. Brick, steel, frame, 3 stories, 100x75 feet, Barrett roof, pine floors, elevators, roof ventilators, dampproofing, iron stairs, fire and kalamein doors, rolled steel sash, electric work (glass reserved). Architect ready for bids.

Bank, Pennington, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, First National Bank of Pennington, care of architect. Brick, cut stone, steel, 1½ stories, 36x63 feet, built-up roof, marble floors, metal window guards, ornamental plaster, vault, vault doors, bronze, tile and marble, metal lath (heating, plumbing, electric and vault reserved). Architect taking bids.

Stores and Apartment Building, 25 South Kentucky avenue, Atlantic City, N. J. Architect, Samuel Abramson, 2313 Walnut street, Philadelphia. Owner, Joseph Myers, Connecticut avenue, Atlantic City, N. J. Brick, steel, 3 stories, 35x81 feet, slag roof, hardwood floors, hot water heat, electric light, tile work, Architect will take bids in a few days.

Administration Building, Bridge Approach, Camden, N. J., $100,000. Architect, Paul Cret, Otis Building, Philadelphia. Owners, Delaware River Bridge Joint Commission, Widener Building, Philadelphia. Limestone, granite, brick, steel, 2 stories and basement, 42x103 feet. Plans about completed. Owners will take bids next week.

School, Deep Water, Salem County, N. J. Architect, C. R. Peddle, 136 South Fourth street, Philadelphia. Owners, Board of Education, Lower Penn's Neck Township, N. J. Cement block, stucco, 1 story and basement, 6 rooms, steam heat, electric light, slag roof, pine floors. Owners taking bids due June 29th, 8 P. M.



Convention Hall, Atlantic City, N. J. Architects, Lockwood, Greene & Co., Inc., 1 Pershing Square, New York. Owners, Atlantic City Board of Commissioners, Harry T. Headley, Director of Streets and Public Improvements, City Hall, Atlantic City, N. J. Engineer, Alexander H. Nelson, Guarantee Trust Building, Atlantic City. Certified check $20,000 to order of City Treasurer. Bond. Deposit, $50 (refunded). Owners taking bids due July 1st at 3 P. M. (Daylight Saving Time).

Bank and Office Building (add.), Fifth and Market streets, Camden, N. J. Architects, Davis, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, Land Title Guaranty Co., Mr. Holyburton, on premises. Brick, cut stone, steel, 4 stories additional, 100x38 feet, slag roof, cement floors, steam heat, electric

light, hollow metal and kalamein doors, ornamental iron work, rubber floors. Architects taking bids.

Residence (alts.), Woodbury, N. J. Architects, H. R. Stackhouse and W. W. Donohue, 1120 Locust street, Philadelphia. Owner, Ralph E. Jackson, Woodbury, N. J. General interior and exterior alterations. Architects taking bids due June 24th.

Sewers, Pensauken Township, N. J. Architects, Remington & Vosbury, 509 Cooper street, Camden, N. J. Owners, Township Committee, R. V. Peabody, Clerk, Camden, N. J. Certified check 5 per cent. of bid. Deposit, $5.00 each set, refunded $3.00. Owners taking bids due June 28th, 8 P. M.

Blowers, various schools, Camden, N. J. Owners, Board of Education, City Hall, Camden, N. J. Certified check or cash, $25.00. Owners taking bids due June 28th, 2 P. M. (Daylight Saving Time).

Residence, 901 North Thirty-fourth street, Camden, N. J., $3,500. Architect, private plans. Owner, F. F. Fry, 301 North Twenty-seventh street, Camden, N. J. Frame, 1½ stories, 24x34 feet, slate surface roof, electric light. Permit issued.

County Asylum (add.), Northfield, N. J. Architect, S. Hudson Vaughn, Guarantee Trust Building, Atlantic City. Owners, Atlantic County Board of Freeholders, Broad Street Bank Building, Atlantic City, N. J. Fireproof, 3 stories, 32x109 feet, slate roof, composition floors, hollow tile, safety treads, roof ventilators, waterproofing and dampproofing, ornamental iron (plumbing, electric and heating separate bids). Lowest bidders: A. B. Bowen, 1 Delancey Place, Atlantic City, $112,000; Philip G. Hannum, Georgia avenue and Thorofare, Atlantic City, $122,956.

Bath Room Addition, Home for Feeble Minded Women, Vineland, N. J. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, Trenton, N. J. Lowest bidders: Thompson-Lockhart Co., 911 North Nineteenth street, Philadelphia, $29,540. Plumbing, J. T. Evans, 158 South Main street, Wilkes-Barre, Pa., $6,326.18. Heating, William L. Bagg, Vineland, N. J., $1,090. Electric, Strang Electric Co., 214 South Seventh street, Philadelphia, $1,374.

Road Work, New Jersey. Owners, State Highway Department, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J.

Middlesex County, Route 1, widening from Metuchen to Rahway. Excavation, penetration macadam shoulders, plain concrete, 3 small span bridge extensions.

Atlantic County, R-14, Section 14, May's Landing-Egg Harbor. Unclassified excavation, double line reinforced concrete pavement, gravel surface. Deposit of $10. Certified check 10 per cent. Owners taking bids due July 7th at 11 A. M. (Eastern Standard Time).

New Jersey Contracts Awarded

School (add.), Brooklawn, N. J., $61,440. Architects, Edwards & Green, 548 Federal street, Camden, N. J. Owners, School Board, Borough of Brooklawn, Gloucester County, N. J. Brick, reinforced concrete, cut stone, steel, 2 stories and basement, 84x60 feet, variegated slate roof, maple and cement floors, hollow tile, metal weather strip, dampproofing, kalamein doors, bond, metal toilet partitions, demolition, cast stone, granite (plumbing, heating and electric work separate bids). Contract awarded to Wills-Bill Co., 1706 Sansom street, Philadelphia. Plumbing to Clifford Duer, Brooklawn, N. J. Heating to John L. Smith, Woodlynne, N. J. Electric to Roland E. McMahon, Woodbury, N. J.

Warehouse, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owners, The Crane Co., 836 South Michigan avenue, Chicago, Ill. Mill construction, steel, 1 and 2 stories, irregular size, slag roof, cement floors, hollow tile, waterproofing and dampproofing, electric light, metal lath, steel sash, fire doors. Contract awarded to M. B. Markland, 3540 Atlantic avenue, Atlantic City.

Court House, Woodbury, N. J. Architect, Charles R. Peddle, 126 South Fourth street, Philadelphia. Owners, Gloucester County Board of Chosen Freeholders, Gloucester, N. J. Trenton brownstone, 1 story and basement, 32x52 feet (plumbing, heating and electric separate), slag roof, pine and cement floors, bond, ornamental iron work. Contract awarded George W. Shaner Co., Palmyra, N. J., $17,483.

Residences (5), 1237-39-43-45-49 Magnolia avenue, Camden, N. J., $22,500. Architect, private plans. Owner, Philip Kalipman, Camden, N. J. Brick, 2 stories, 15x44 feet, slag roof, hot water heat, electric light, garages (4) in rear, each 1 story, 10x18 feet. Contract awarded to Harry Vansant, 550 Haddon avenue, Collingswood, N. J.

Sales and Service Station (add.), 1400 Haddon avenue, Camden, $10,000. Architect, private plans. Owner, Henry Mianowski, Camden, N. J. Brick, second story add., 40x100 feet, slag roof. Contract awarded to Frank Valeriani, 259 Spruce street, Camden, N. J.

Residences (2), 1644-46 Maryland street, Camden, N. J., $9,500. Architect, private plans. Owner, Andrew Miller, 1162 Everett street, Camden, N. J. Brick, 2 stories, 15 feet 6 inches x 48 feet, slag roof, hot water heat, electric light. Contract awarded to Bruno J. Wilinski, 1213 Mt. Ephraim avenue, Camden, N. J.

Residence, 1116 North Twenty-sixth street, Camden, N. J., $3,300. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, John Lynch, 1148 North Twenty-sixth street, Camden, N. J. Brick, 1 story, 16x42 feet, slate surface roof, hot air heat, electric light. Contract awarded to Wesley H. Bauck, 2700 Cramer street, Camden.

Miscellaneous Construction News

Hotel, Washington, D. C. Architect, E. L. Rothschild, Bankers' Trust Building, Philadelphia. Owner, name withheld. Brick, limestone, reinforced concrete, terra cotta, granite, 7 stories, 48x102 feet, slag roof, cement floors, hollow tile and gypsum partitions, elevators, vapor heat, electric light, tile and marble work, rolled steel sash, kalamein revolving doors, ornamental plaster. No kitchen or dining room equipment. Plans in progress.

Women's Educational Building, Morgantown, W. Va. Architects, Davis, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, University of West Virginia, Morgantown, W. Va. Brick, cut stone, steel, 4 stories and basement, 114x51 feet, 51x34 feet, 90x58 feet, slag, slate and cement roof, cement, maple and terrazzo floors, hollow tile, concrete work, swimming pool(gym, waterproofing, metal lath, tile work, metal sash, ison stairs, ornamental iron work. Deposit $25.00, refunded. Architects taking bids due July 2nd, 3 P. M.

Manufacturing Plant, Fairport Harbor, Ohio. Archtiects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, P. C. Tomson & Co., 27 Washington avenue, Philadelphia. Reinforced concrete, steel, brick and hollow tile, 2 stories, 221x121 feet, slag roof, cement floors, flat slab construction, steam heat, electric light, plumbing. Owners taking bids due June 29th.

Residences (2), Fourteenth street, Wilmington, Del., $10,000. Architect, private plans. Owner, George S. Charles, 701 Tatnall street, Wilmington, Del. Brick, 2 stories, 14x50 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

Garages (20), Scott and Lincoln streets, Wilmington, Del., $5,000. Architect, private plans. Owner, P. J. Ford, 622 North Broome street, Wilmington, Del. Concrete block, 1 story, 96x20 feet, slag roof, concrete floors. Permit granted.

Miscellaneous Contracts Awarded

Residence, Chatham, N. Y., $36,000. Architects, Folsom, Stanton & Graham, 10 South Eighteenth street, Philadelphia. Owner, Dr. Robert S. White, Third and Chestnut streets, Philadelphia. Frame, 2½ stories (heating reserved), electric light, tile work, shingle roof, hardwood floors, plumbing. Contract awarded J. H. Dawson & Son, Folcroft, Pa.

Store, 724-26 King street, Wilmington, Del., $30,500. Architect, private plans. Owner, H. Kaufman, on premises. Brick, 2 stories and basement, 36x10 9feet, hardwood floors, elevators, plate glass, electric light, tile and marble work. Contract awarded to D. Cantera, 1911 West Ninth street, Wilmington, Del.

Residences (4), Wilmington, Del., $24,000. Owners, Newport Land Investment Co., Industrial Trust Building, Wilmington, Del. Brick, 2 stories, 20x32 feet, slag roof, pine floors, hot water heat, electric light. Contract awarded to P. J. Fahey, 622 North Broome street, Wilmington.

Community Garage, Van Buren street, Wilmington, Del., $4,800. Owner, Mrs. Addie Vandever, 700 West Twenty-first street, Wilmington, Del. Brick, 1 story, 9x18 feet each, slag roof, concrete floors, electric work. Contract awarded to B. H. B. Ennis, Jr., Baltimore, Md.

Proposal

SEALED PROPOSALS, addressed to the Chairman of the Building Committee. will be received by Board of Trustees, Laurelton State Village, Laurelton, Union County, Pennsylvania, until 10.30 A. M., July 3, 1926, and then and there publicly opened for the following items:—

1. Cottage No. 8. Construction, plumbing, heating and electrical work.
2. Water main.
3. Sewer main.
4. Steam distribution system, including piping and auxiliaries in Boiler House; underground system of piping; alteration and additions to heating and hot water systems in buildings.

Proposals will be considered only from individuals, firms or corporations possessing satisfactory financial and technical ability: equipment and organization to assure speedy completion of the contract, and in making awards, the records of bidders for expedition and satisfactory performance on contracts of similar character and magnitude will be carefully considered. Drawings and specifications

may be obtained upon application to George S. Idell, Architect, 1510 Chestnut Street, Philadelphia, Pa., for Items 1, 2 and 3, and from Stewart A. Jellett Company, 1200 Locust Street, Philadelphia, Pa., for Item 4, upon a deposit of $10.00 payable to Laurelton State Village, as security for safe return of the drawings and specifications within ten (10) days after date of opening proposals.

A certified check for five per cent. (5%) of bid or an approved bidder's bond to the amount of five per cent. (5%) of bid must accompany all proposals, as a guarantee that successful bidder will execute the contract and furnish a satisfactory surety bond in the full amount of same.

Architects, Contractors, Builders, Estimators, Appraisers and Engineers will be interested in the "New Building Estimators' Hand Book," by William Arthur, published by the Scientific Book Corporation, 15 East 26th Street, New York City.

All data regarding the cost of construction work, the price of materials or supplies, or the estimate on any structure, from a bungalow to a skyscraper, are contained in this book.

In compiling the "New Building Estimators' Hand Book" Mr. Arthur has drawn not only from his own wide experience, but from that of the leading industrial concerns in America allied with the building trade.

There is a complete set of tables covering all phases of estimating in the entire structural field. In the computations of many estimates, for example, flexibility is gained by using a flat rate unit per hour based on one dollar per hour for mechanics and sixty cents per hour for laborers.

By using this basis the carpenter or builder may readily adapt the tables to any local rate. Attention is given to the time required to install materials and arranged so that any rate of wages may be applied.

This is a book that will never accumulate dust on the estimator's desk, for every branch of the building industry is covered and no detail is too small for consideration.

The price of the "New Building Estimators' Hand Book" is $6.00, and it may be purchased through the BUILDERS' GUIDE, 1530 Chestnut Street, Philadelphia.

(Continued from page 388)

ation before laying the sheet asphalt surface course. This binder course is similar to the asphaltic base mixture mentioned above. It consists of stone ¼ of an inch to ¾ of an inch in size, which is mixed with sand and asphalt cement and laid in the same manner as later described for the sheet surface course. The binder course mixture should have the following proportion by weight:

Stone retained on a sieve having 10 wires per inch—60 to 80%.

Sand passing a sieve having 10 wires per inch—15 to 35%.

Asphalt cement (pure bitumen)—4 to 6%.

The sheet asphalt surface course, which will not require the above described binder course if the foundation be of asphaltic concrete or portland cement concrete, should be from 1 inch to 1½ inches in depth. In order to obtain the best results a carefully graded sand should be employed. This, when mixed with the asphalt and limestone dust, which should pass a sieve having 200 meshes per inch, should give a mixture which will have the following composition by weight:

Sand passing a sieve having 10 meshes per inch and retained on a sieve having 40 meshes per inch—10 to 40%.

Sand passing a sieve having 40 meshes per inch and retained on a sieve having 80 meshes per inch—22 to 45%.

Sand passing a sieve having 80 meshes per inch and retained on a sieve having 200 meshes per inch—12 to 30%.

Dust passing a sieve having 200 meshes per inch—10 to 20%.

Asphalt cement (pure bitumen)—9.5 to 12%.

The asphalt cement for both the binder and surface courses should be of a consistency such as to show a 50 to 60 penetration test when used in warm climates and from 60 to 70 when used in cold climates where the temperature falls below 10 degrees F.

The above mixture should be prepared at a paving plant where the sand and asphalt can be heated to approximately 350 degrees F. A temperature above 400 degrees F. is not desirable since it tends to injure the asphalt. The quantity of asphalt paving mixture necessary for one or two tennis courts would hardly be sufficient to justify the setting up of an asphalt paving plant, it is therefore desirable to obtain the mixture either from a municipal plant or a contractor's street paving plant in the vicinity. After it is prepared the mixture can be hauled hot by truck any distance ranging up to 20 miles if necessary.

Where a hot-mix asphalt plant is not available a cold mix may be made with especially treated asphalt products known as emulsified asphalts and cut-back asphalts which are liquid at ordinary temperatures. Satisfactory materials of this kind are on the market and can be mixed with unheated sand to produce a paving mixture that will harden in a few days and produce a stable surface.

The surfacing material should be dumped from the trucks upon boards or platforms from which it can be spread by shovels over the prepared foundation course and then raked to a depth such that after rolling it will be at least one inch thick. Rolling should follow shortly after the spreading and while the mixture is still pliable. Thorough compression is essential and while heavy hand rollers will give satisfactory results it is preferable to use a power roller of at least five tons' weight if one is available. After thorough compaction has been obtained it is desirable to sweep over the surface a sprinkling of limestone dust or portland cement and to finish the surface with a final rolling in all directions diagonally and longitudinally.

An asphalt surface does not produce glare under sunlight. It has a dark gray color that is restful to the eye. In some cases, however, it has been thought desirable to tint the surface with a green cromic oxide paint to give it more nearly the appearance of the grass court. Various other solutions are also to be found on the market for this purpose and can be applied by means of a forced spray. The lines are marked out by means of stencils with a solution in white. The best results are obtained by applying the solution in two thin coats. The second coat should not be attempted until after the first has thoroughly dried. On some courts a special finish has been used which gives the surface a pleasing color of deep red.

The penetration method of construction is also used sometimes for court surfacing. The usual procedure is to spread a uniform course of crushed stone 1½ inches to 2 inches in thickness upon the foundation of cinders, crushed stone or gravel. The stone used should be ¾ inch to 1¼ inches in size and should be rolled dry sufficiently to set it in position. Over the dry stone, which should present a firm, true surface of even texture, is poured asphalt cement heated to about 300 degrees F. The asphalt cement should be of a consistency that will give a penetration test of 100 to 150. About one-sixth of a gallon of asphalt per square foot will be required completely to coat the stone in this surface course. A cover of stone chips usually is spread over the surface, followed by thorough rolling. A hot hand-roller has been found to give sucient compression, but a 5 ton roller is preferred. In order to obtain a smoother surface it is sometimes desirable to apply a second light coating of asphalt cement. This treatment is but one-fourth as much as the first and is covered with fine stone chips and finished by thorough rolling. The penetration type courts have turned out to be very satisfactory but since the surface is not as accurate as that obtained from the mixed types, the penetration court generally is not used for tournaments.

The accompanying table gives the quantities of materials required for the courts above described.

FOR ASPHALT TENNIS COURTS
QUANTITIES OF MATERIALS REQUIRED
(Per square foot of paving)
(one inch thick)

Material	Compacted found. per 1 inch Thick. lbs.	Asphaltic binder course per 1 inch Thick. lbs.	Sheet Asphalt surface per 1 inch Thick. lbs.	Penetration macadam surface per 1 inch Thick. lbs.
Crushed Stone	10	8.6		12.0
Sand		3.3	8.5	
Stone Dust			1.6	
Asphalt Cement		0.7	1.2	0.9
Total	10	12.6	11.3	12.9

NOTE—Stone weighs (loose) 2400 to 2800 lbs. per cu. yd. Sand weighs from 2300 to 2600 lbs. per cu. yd. Asphalt weighs from 8.3 to 8.8 lbs. per gallon.

Another and less expensive method of obtaining a desirable tennis court surface is that of the treatment of a sand clay or gravel base with an asphaltic oil. For a new court it is preferable to construct in the usual manner a gravel or sand-clay base and use it for several months so that it will become thoroughly set. The surface is then dragged and carefully brought to a true plane. Upon this is sprayed a light coating of asphaltic oil at the rate of about 0.03 gallon per square foot, or a total of about five barrels for a court 60 feet by 120 feet. This surface is then covered with fine stone chips or coarse sand and is allowed to stand for twenty-four hours. About 1½ to 2 tons of cover materials are required to each barrel of asphaltic oil used. A roller, if available, may be used to advantage. The asphaltic material may be a liquid which can be applied cold, or on a gravel surface a somewhat heavier asphaltic oil which must be heated before application can be used. When the lighter oil is used, renewed applications will be required about every year, while with the heavy hot oil several years may intervene between applications. And after several treatments a lasting surface will have been built up.

IDEAS ABOUT INSULATION

BY HARRY CARLETON

With the same profligacy with which we have spent our national resources, so we have built our houses and buildings. We have built them so that they leaked heat like a sieve, and have let cold percolate through the walls so that extravagant heating plants have been taxed to the limit to keep us in that hot house state of heat our comfort seems to demand.

Then all of a sudden, we come to earth and begin talking about conservation and insulation, and several firms begin making insulating materials and advertising them with great "wim and wigor." The building public is urged and begged to insulate its houses with this and that, and it is told that wrapped in a blanket of "Blank" insulation, it will be snug and safe from cold wintry blasts and cold and comfortable in summer monsoons.

Undoubtedly many of these insulating materials have merit; doubtless they will render efficient service; but without doubt not a one of them is of any value whatsoever unless properly installed. The best material in the world, improperly used, will not render service, while a poorer material, carefully used, will give splendid results, and this applies to all materials.

A little resume of physics is necessary so that the problem of insulation may be handled properly. In physics we learn that only confined dead air broken into tiny pockets offers proper insulation. We learn also that heat rises, or that heated air rises, and cold air falls. We know that a seat under the roof in a theatre is hotter than an orchestra seat, thus proving the things we were taught in school. We also know from experience that if we cover all parts of our bodies even lightly that we are more immune to cold. Let's accept these things as facts and then apply them to building.

The walls and roof of a building are the protection against the elements, the windows and doors are the bare hands and feet, and any other opening, no matter how minute, offers another chance for leakage. We cannot live in windowless and doorless houses, so the best we can do is to weather-strip these openings with the best strips obtainable and stand the heat loss through the glass. In case of very exposed locations with high winds, storm windows offer excellent proection and keep out heat losses. Every house owner should carefully examine the putty around the glass in his windows, for loose and broken putty often is a source of leakage.

When it comes to the walls, we must be careful to seal them all tightly, and make certain that no only are the big areas blanketed but also that the blanket carries tight against or into frames, for here is a prolific source of loss. The best of workmanship and care is necessary to obtain results, for unless a tight joint obtains between the edges of the insulation, a lot of expense is entailed with negligible results.

Recently I saw a frame house that was being insulated, and wide gaps appeared between the sheets of insulation. This sort of shoddy workmanship offers no protection worth mentioning. I have seen a roof carefully insulated—and the cornice left exposed. Until some method of stopping shrinkage in materials is found we are bound to have shrinkage cracks, and cornices should be carefully insulated.

In frame houses it is advisable, even after careful insulation is applied to the walls, to break the vertical air spaces between studs as often as possible with bits of board or insulation. These breaks serve to obstruct the passage of air, and air in motion is useless as insulation.

In brick and hollow tile houses, it is often difficult to seal the mortar joints at the ends of the tile. One builder solves this problem neatly. After the furring is erected, he applies a light coat of cement mortar to the tile between the strips, and this seals the wall. He also is careful to slush the joint between tile and brick full of mortar, and to use wooden wind breaks at all openings. These two operations seal whatever air there may be in the wall very effectually, and prevent currents from moving.

With the demand growing for insulation, there are a number of new products on the market. Some of them are excellent—a few seemingly were created only for the purpose of sale and have little merit. Some lend themselves easily to use, others require much labor. When you choose insulation, choose by quality rather than price, and give its installation the maximum of inspection.—*Building Industry.*

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

Concrete Pits Waterproofed With "ANTI-HYDRO" are Always Dry

The concrete pits in this building, as well as the tunnel under the railroad, are waterproofed with "ANTI-HYDRO". Both pits and tunnels are always dry.

"ANTI-HYDRO" permanently waterproofs concrete against any head of water. It also hardens concrete and makes it acid alkali and oil resisting all in one operation. Easy and economical to use, because it is a liquid integral compound, which mixes readily with the gauging water without the aid of skilled labor.

Some "ANTI-HYDRO" jobs are 22 years old, yet they look like new. That's because "ANTI-HYDRO" results are permanent Use it on your next job for guaranteed satisfaction.

As The Editor Sees It

OIL ENGINES WILL HAVE PLENTY OF FUEL

Owners Need Not Fear Shortage of Oil Says James O. Lewis

No danger exists of a scarcity of fuel for the constantly increasing number of oil-burning engines in use in industry and transportation throughout the country, according to James O. Lewis, former Chief of the Petroleum Division of the United States Bureau of Mines and a recognized authority on the petroleum situation.

Writing in the June issue of *Compressed Air Magazine*, Mr. Lewis points to a future supply of petroleum from undeveloped fields and also from oil shale and through distillation of coal and lignite which, he says, along with more economical utilization of available supplies for all uses, removes any fear of an oil shortage.

Apprehension as to the future supply of oil, Mr. Lewis says, has interfered with a more wide-spread use of the internal combustion engine of the so-called Diesel oil-burning type, whose economy of operation is its distinctive feature. This apprehension, he characterizes as unjustified, in light of analysis of the country's potential petroleum reserves.

Mr. Lewis writes, in part, as follows:

"Perhaps the situation may be summarized as follows: Supplies of cheap, 'flush' oil from new pools cannot be counted on to meet all demands for many years to come; other undeveloped sources of supply are incomparably greater than the resources from which oil has been obtained up to this time, and these latent resources should meet all our more essential needs indefinitely—among these needs being fuel oil for oil engines; and, when it becomes necessary to rely on these latent resources, higher, yet not excessively high prices may be expected for petroleum products. Higher prices at such times will, no doubt, cause many users of cheap fuel oil to revert to the use of coal or to other alternative sources of heat and power. Even so, the oil engine will have such a margin of advantage over the other users of fuel oil that it will be able to compete successfully for supplies under well-nigh every conceivable contingency.

"For some years in the recent past there was an oversupply of crude oil, caused by the discovery of new fields and the working of them faster than markets could be extended to absorb the increased production. Such periods of overproduction have alternated with periods of undersupply, and no one can foretell how these changing circumstances may succeed one another or how long each will endure. It is obvious, however, inasmuch as just so many pools will be discovered, that eventually the time must come when new pools can no longer be found fast enough to offset the decline of old wells—in short, the pools will not be able to provide for continually increasing consumption.

"Were there no other resources, the situation might be alarming; but we are coming more and more to evaluate not only the limitations in discovery of such new flush pools—with attendant cheap oil—but also the almost unlimited latent resources, which because of this low-priced oil, we have not had occasion to develop. These latent resources are numerous, and our future oil needs will be met from the sum of them rather than from any one of them. Production from new flush pools will not disappear overnight; but a time will come, possibly within the near future, when such production will reach a peak

and thereafter gradually decline. The problem will then become one of filling in the gap between this declining production and the ascending demand for oil.

"What are these other resources? First of all, because in that way it will be possible quickest to meet any deficiency, it will be necessary to increase importation of oil from foreign countries—principally from South America. During the past decade explorations have gone on continuously in Venezuela and Columbia, and fields have been discovered that should provide large supplies of petroleum when fully opened up; but, because of the greater cost of development in foreign countries, this oil from alien sources will probably not be so cheap as oil is at present.

"Let it be emphasized at this point that we are by no means dependent or likely to be dependent upon foreign sources of supply to make up a shortage in fuel oil. We know, as a matter of fact, that but a fraction of the oil underground in any of the domestic fields is being extracted from our oil sands by methods commonly employed—ways will be made available by which a considerable percentage of this residual oil will be recoverable. By two different processes, already devised, oil extraction has been increased in some wells from two to four times and under profitable commercial conditions, and a third process has been worked out which has proved of practical success in Europe. It has been demonstrated conclusively that the oil remaining in the sand—after mining by the usual method—varies from three to nine times more than the oil already extracted from the pools in question. What average increase in extraction may be looked for cannot now be fixed with any certainty—in fact, the output will be determined largely by the price asked for the oil and what outlays will be warranted in recovering it; but it is clear that tremendous increase in the yield will come from existing oil fields.

"Considered upon a potential quantitative basis, the most important latent resources of fuel oil is our oil shales. These exist in enormous measures in both the eastern and western parts of the country. Oil shale resembles a poor grade of cannel coal; and to obtain the contained oil it is necessary to mine, to crush, and to retort the shale. The quantities of oil in such shale deposits are vastly greater than the amounts of petroleum in our oil sands. Even so, the exploitation of our oil shales will require an immense sum of money and involve much time to develop satisfactory extraction methods and to install equipment of sufficient capacity to supply enough oil to meet any large share of our needs.

"Oil from oil shales will be available shortly, but in relatively small quantities; and the output will gradually supplement our other sources of supply as the technique is developed which will render practicable the commercial extraction of this oil on a suitable scale. Oil from these shales will be relatively but not excessively high-priced oil.

"Other promising sources of liquid fuel are oils produced by the low-temperature distillation of coal as well as alcohols from various waste vegetable products and other sources. Some allowance must also be made for processes and sources not as yet demonstrated as commercially feasible—such as the chemical treatment of coal, etc., or the development of other power sources which seem remote today and yet may prove important factors in the life of an oil engine purchased at the present time. Any product that will replace gasoline will have its effect upon existing fuel oil because much of the gasoline now available is obtained by processing fuel oil.

"The outstanding fact, so far as it concerns the expected useful life of an oil engine bought today, is that the future supply of liquid fuel can be drawn from large and varied sources, and the utilization of these is now merely awaiting de-

mand. In short, a serious depletion of our oil supply is inconceivable in view of the known facts and the avenues of relief which have been opened up in part and which are susceptible of nearly unlimited development."

CORRECTLY APPLYING THE LOCK

By B. A. McCuen

It is generally known that misapplication of a lock set results in unsatisfactory operation. Too often the source of the difficulty is not known by the users with the result that the hardware receives the blame.

A lock that is correctly applied will work with the same ease and smoothness of action as when it passes final inspection at the factory. Installation, then, is a matter of no small importance.

Inaccurate measurements are usually responsible for the binding which impedes free-working of the lock. Complicated methods for obtaining the center at which to bore hole for cylinder, knob, thumbknob or thumbpiece instead of increasing the degree of accuracy bring about a negative result and hence improper operation after lock is installed.

This difficulty is encountered all in addition to the time lost in figuring, measuring and calculating. Small items of time, perhaps, but on extensive jobs where many lock sets are installed, the accumulated loss is considerable.

Actually the application of a lock set is a very simple task. These few simple instructions will be helpful to those who

Just as in the case of every building material and specialty, poor workmanship reflects unfavorably on the quality of the product. Good hardware receives thorough factory inspection, but its manufacturers cannot follow it to its final installation. When locks, hinges and similar hardware arrive on the job their application is too often left entirely to the workmen. Every builder should make sure that an adequate equipment of tested hardware is provided and installed correctly.

are seriously concerned with the problem. There are many whose methods are similar or at least equally as good. These men as well as those who are having poor luck in making satisfactory installations will find these rules simple and positive means of turning out a good job.

First, mortise the lock into edge of door at the center of its thickness and at specified distance from floor. Then, remove lock from door and on the side that corresponds to inside of door, place a square horizontally across it, so that it passes through center of hub for thumbknob. Make a light pencil mark on face of lock where the square intersects.

Next, slide square downward until it is on a line with center of hub for the knob and mark location on face of lock. On the opposite face, line square up with the bottom of the trip for the thumbpiece on the lower edge of the lock case. Mark location on face.

Measure the distance from the face of lock to the center of cylinder and draw a vertical line at this distance from the edge of door on both sides.

Now you may replace lock in door and with the square draw horizontal lines from each of the marks on the face of lock, so that they intersect the vertical lines.

On outside of door, using the upper intersection as a center, bore an 1¼ in. hole to the mortise only. Bore a ⅝ in. hole to the mortise at the lower point and chisel to the proper size and shape. Take care that the opening does not extend beyond the top-plate of handle.

Finally on the inside of door bore a ⅜ in. hole at the upper point and a ⅝ in. hole at the lower. These holes to extend to the mortise only.

Building Age and Natural Builder.

TENDENCY TOWARD BAKERY CONSOLIDATION OFFERS INCREASED FIELD FOR ELECTRICAL POWER COMPANIES

The recent announcement of a consolidation of several large baking companies with offices and plants in several of the larger cities has forcibly directed the attention of the electrical industry toward the increased utilization of electrical power in these plants.

In this respect, the use of air and electricity go hand in hand in the modern bakery. Without either, it is doubtful if the enormous progress accomplished in the last ten years when bakery-made bread has increased from 10 to 60 per cent. of the total product consumed, would have taken place.

As a manufacturing process, and the making of bread has indeed become a mechanical production job, the use of air, water and chemical formulas has become of vast importance in the baking industry. Every operation connected with the modern bakery is the result of scientific study, from the weighing of the flour, water, lard and other ingredients, to the wrapping of the loaves in oiled tissue and the mechanical work is minutely regulated.

Records indicate that it was sixteen years ago that the first consolidation of large bakeries was accomplished when the General Baking Company brought under one organization, plants in New Orleans, Toledo, Buffalo, Washington, Providence, Canton, Cleveland, New York and other large cities. The organization of this large company immediately affected one major operation of interest to electrical power companies and other manufacturers—the standardization of equipment and commodities used. This standardized production has greatly increased the consumption of electrical current in our larger cities.

Generally speaking, there are four major operations in which the use of electrical power has been stabilized in the modern bakery. These include the operation of various types of fans, the operation of humidifying apparatus, (a very important feature in all modern baking plants) the use of current in various mechanical operations, and the consumption of electrical power in the operation of the huge ovens.

Air is most essential in the large modern bakery. Ventilating fans, which remove the fumes from the baking processes, and provide fresh air for employees, at the same time remove the heated air from the baking rooms. The number of fans for this purpose and the current consumed depends primarily upon the size of the baking plant and the output, but this feature constitutes an important feature in the consumption of electrical power. Another use of fans in the baking business, particularly interesting to electrical companies, is in oven cooling. When the day's baking is completed, it is desirable to remove all remaining heat from the ovens by means of electrically operated fans and, in its stead, substitute fresh air during the period the ovens remain idle.

The successful baking of bread on a large scale, where thousands of loaves are produced in an hour, demands the most delicate means of humidification. Scientists claim that it is in this feature, plus the fact that large units can operate more cheaply than can the home oven, that has caused the modern bakery to supplant the kitchen process. There is not a modern bakery that does not employ humidifying or air conditioning processes in preparing its product.

An interesting illustration of this feature is found in the new Holland Bread Company plant in Toledo, Ohio, where a large air washing machine provides exactly the correct amount of moisture in the oven air for the best results. The air is blown through this air washer by electrically operated fans and then driven into the ovens to insure fresh bread.

Because of its cleanliness and dependability, electrical power has been almost universally adopted for mechanical operations in the modern bakery. Huge mixers, that never get tired at the elbows, conveyors for dough and finished loaves, lighting systems and mechanical wrappers are all operated by electrical power.

The maintenance of a constant heat is necessary in the preparation of our bread and other baked dainties. Hence, electrical ovens are standard in most modern bakeries where thermostatically controlled ovens bake out thousands of loaves on an exact schedule each hour.

The manager of a branch of one of the largest bread companies recently declared that there is not a single operation in their plant that is not directly operated by or influenced by electricity. And inasmuch as human hands, except in loading and unloading the wagons, never touch the product, the far-reaching effect of electricity in the baking industry is easily seen. It is a fact that the bread baking business is one of the cleanest production industries known, and to this end, the use of electricity has contributed considerable assistance. It is safe to say that, without electrical current and various applications of air, the baking industry would still be confirmed to the thirty or more million kitchens in the United States.

The Concrete Pit in this Building is Below Tide Water—But "ANTI-HYDRO" Keeps It Dry

VACUUM COMPANY BUILDING STATEN ISLAND N Y
BARNEY-AHLERS CONST CORP ENGINEERS AND CONTRACTORS

Extreme conditions surround the sterilizing pit in this building. Unusual water pressure on the outside and acid fumes on the inside.

This pit is permanently hardened and waterproofed with "ANTI-HYDRO," which also protects the concrete from the deteriorating effects of the acid. In one operation "ANTI-HYDRO" hardens and waterproofs concrete and makes it acid, alkali and oil resisting.

Being a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the gauging water. No skilled labor is required. Results are *guaranteed permanent.*

Twenty-two years of successful use is your assurance of satisfaction. Use "ANTI-HYDRO" on your next job.

BRICK

TOADS

in brick language, are culls, bats, clinkers or lammies. In years past they went to the dump. Today many of them are being sold as Colonials. That is why prices vary so greatly on so-called Colonials.

A genuine Colonial will run from $30.00 a M for a Philadelphia Colonial or Antique to $50.00 for a hand-made, wood-burned New England Colonial. The difference in price is principally in the freight.

We are furnishing Colonials for many suburban schools and apartments. We shall be glad to serve you, too, if you want Colonials instead of toads.

As The Editor Sees It

THE semi-annual report of building operations in Philadelphia for the first six months of this year published in full on other pages of this issue of the GUIDE, shows a decline of over $15,000,000.00 in total value of work for the half year just ended, compared to the first six months of 1925.

The total work of all kinds for which permits were issued in the six months ending June 30 was $70,199,500, compared to $86,014,515 for the first six months of 1925. The number of operations shows a decrease of 3,494 for the same periods.

To June 30, 1926, permits were issued for 6,597 new buildings at an estimated cost of $61,914,685; alterations and additions, 3,353 permits amounting to $7,657,895 were issued, and miscellaneous permits, 1,188, amounting to $626,920.

The greatest decrease is noticeable in residences. Every month of the first six months of this year, excepting January, showed material decrease in two-story residences. The total number of two story residences started in 1926 to June 30 was 4,965, costing $23,582,225, whereas in the corresponding period of 1925 there were 7,730 two story residences, costing $41,276,145, started, showing a decline of 2,765, at a loss of $17,693,920. Residences of the three story type, the one story type, and the frame type all showed large decreases in the same period.

For the first time in many semi-annual reports, garages made a smaller showing, a decrease to date in 1926 from 1,320, costing $4,218,945, in 1925, to 906, costing only $2,616,235. This unquestionably manifests a falling off in demand for small residences with garages, emphasizing the fact that Philadelphia is nearing, if not already having reached, a situation where small houses are not moving rapidly. Manufactories show a marked increase from 34, costing $1,825,820 in 1925 first half year, to 40, costing $4,507,650 in same period 1926. Tenement houses, like residences, showed a considerable decrease from 52, costing $11,367,000 in 1925, to 35, costing $4,507,000 in 1926 to date Schools show an increase from 8, costing $4,418,555, in first half of 1925, to 9, costing $5,422,505, in 1926. Office buildings show an increase from 19, costing $3,907,000, to 25, costing $4,444,850 in same periods. Buildings for the Sesqui-Centennial Exhibition, 108, costing to date $4,229,455, helped to overcome some of the losses in total building value.

June, of 1926, was the largest month on record for this year, with a record for this month greater than any corresponding month in the history of building in Philadelphia. Permits were granted in June for 1198 operations costing $16,642,745. This is an increase of nearly $3,500,000 over June, 1922, which was, until last month, the best June on record. With the exception of February, which showed a small increase over February, 1925, June was the only month so far that showed an increase over 1925.

The record for the first six months of 1925:

Month	Permits	Operations	Estimated Cost
Jan.	614	964	$ 6,567,755
Feb.	957	1,929	10,320,835
March ...	1,718	4,164	22,424,530
April	1,461	2,848	21,110,645
May	1,369	2,423	14,434,300
June	1,310	2,304	11,156,450

The record for the corresponding six months of 1926:

Month	Permits	Operations	Estimated Cost
Jan.	684	1,208	$ 7,590,755
Feb.	647	1,081	9,108,245
March ...	1,230	2,524	15,065,885
April	1,436	2,456	11,381,330
May	1,242	1,971	10,410,540
June	1,176	1,198	16,642,745

The records for first six months of the last ten years:

1915	923	1700	$ 3,873,850
1916	873	1709	5,147,115
1917	618	763	2,328,755
1918	564	694	1,671,900
1919	1073	1951	7,354,625
1920	1171	1213	6,743,015
1921	1280	1406	4,587,395
1922	1492	2461	13,190,220
1923	1334	1742	8,370,875
1924	1577	2040	11,108,880
1925	1310	2304	11,156,450

In two story dwellings the forty-second ward showed the largest number started, 1,214; but this same ward showed the largest decrease compared to the first six months of 1925 when 2,104 dwellings of this type were built. The thirty-fifth ward was second in number of two story dwellings started, with 1,181, and this ward showed an increase in 1926 from only 782 in first half year of 1925. Marked decreases were manifested in the wards 21, 22, 23, 26, 34, 38, 39, 40, 41 and 48. Increases were noted in wards 33, 43, 45.

The careful builder of the future will use chemically treated lumber wherever decay favoring conditions exist about the house, according to predictions made by M. E. Dunlap of the U. S. Forest Products Laboratory.

"The use of treated wood, and particularly one-inch and two-inch boards impregnated through and through, will offer a solution to the decay problem of the home owner just as the use of treated ties has enabled the railroads to reduce their tie renewals by 60 per cent. or more," said Mr. Dunlap.

"At present, retail lumber dealers do not carry stocks of treated boards or timbers nor do treating plants exist which specialize in treating ordinary lumber. Treated boards for ordinary construction work, to be really resistant to decay, must be impregnated through and through, a result difficult to obtain except in an efficient large-scale pressure impregnation plant.

"With the use of through-treated boards. the builder will be free to cut boards to length at will without the necessity of resorting to the not always dependable brush treating methods used to cover untreated wood exposed on cut ends.

"For many purposes treated boards to be readily marketable will have to be paintable, although this will not be true for all uses. In many places it should prove practicable to use creosote, a preservative which has so far proved difficult to paint."

Anticipating the demand for through-treated lumber the U. S. Forest Products Laboratory has started studies both of methods of getting complete penetration of building lumber and of painting over woods impregnated with zinc chloride, sodium fluoride, creosote and other preservatives. Results of these studies, according to Mr. Dunlap, will probably not be available for some time but it is expected that the study will be well abreast of economic developments leading to the general use of treated lumber.

GARAGE VENTILIATION AN IMPORTANT FACTOR TO THE CONTRACTOR AND BUILDER

With an actual registration of approximately 20,000,000 automobiles in 1925 and a contemplated 1926 production of 3,000,000 more, the local contractor and

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Craig, Wilmington, Del.

Residence, 2321 Pennsylvania avenue, Wilmington, Del., $9,000. Architect, private plans. Owner, Ernest Lomox, 610 West Twenty-sixth street, Wilmington, Del. Cinder block, 2 stories, 21x31 feet, composition roof, pine floors, hot water heat, electric light. Contract awarded to C. W. Griec, Newark, Del.

(Continued from page 420)

builder cannot afford to neglect a survey of both public and private garage construction in his territory as a basis for future business.

Reliable statistics estimate that more than 35 per cent of the automobiles in the United States are daily kept in public garages. This fact gives definite importance to the public garage and its effect on the building trades.

The present concentrated drive by government officials, health authorities and physicians against the carbon monoxide peril in motor car garages offers an important item for the consideration of all contractors and builders.

Agitation against this insidious poison has apparently reached its height this spring. In every state and large community health officials, government officers and powerful associations are taking

up the fight against carbon monoxide to prevent its tremendous loss of life.

Just how does this affect the building trades?

To understand the deadly work of carbon monoxide provides the clew. Created by the operation of internal combustion engines, of which the automobile engine is a type, carbon monoxide gas is released through the exhaust pipe. It gets in its deadliest work chiefly in the garage where it is usually confined because of a lack of proper ventilation precaution. But from one and one-half to three minutes is all that is necessary to cause death when exposed to this gas, in the opinion of medical authorities, and insurance investigators agree that it is one of the most deadly of gasses, particularly because it attacks without warning and gives the individual but small opportunity to escape from its ravages.

More than eight million of these 23,000,000 automobiles of 1926 will be kept in public garages, and it is that carbon monoxide is most dangerous. Obviously, in constructing a modern weather and

storm proof building, contractors and builders have perhaps not prepared for the release of this poisonous gas flow in the garage.

Herein lies the opportunity for every contractor and builder to assist, not only in increasing their own profits, but in eliminating a great national health hazard whose enormous death toll increases each year directly in proportion to the increases in the use of motor vehicles.

Every garage, large or small, should have adequate provisions for the removal of carbon monoxide gas fumes through the installation of a proper and approved ventilating system. It is in this respect that the contractor and builder should make a mental note in his survey for future business. Countless new garages are built each day, and great is the opportunity in this field for increased business. The inclusion of an adequate ventilation system should be made in the cost estimate to the owner, and this important item should be stressed further by calling the attention of the owner to the local regulations governing such installations.

There are but few communities in which the terrific toll of carbon monoxide gas is unknown, and every day's news tells further of this fatal gas. No garage builder can fail to be impressed of the danger of a running engine in a closed garage, because of the unhealthy effect on his workmen. While many states and cities have passed laws and ordinances governing the ventilation of garages, the contractor and builder is allotted the opportunity of creating further standards in health work. To the contractor who will take the time and trouble to drive home the point of proper ventilation is due great credit in assisting to improve the health conditions of his community.

"Camouflage" doesn't pay in advertising Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

WORLD FAMOUS STRUCTURES

THE old State House, or Independence Hall, in Philadelphia, was commenced in 1731 and was ready for occupancy by the Assembly toward the close of 1735. It is an interesting specimen of colonial architecture, substantially built of red brick, with black glazed headers.

It was occupied as the State House until 1799, when the Capital was removed from Philadelphia. In the East Room, the Declaration of Independence was adopted, as were also the Articles of Confederation and the Constitution of the United States.

Prior to 1876, both the exterior and the interior of this historic building were restored as nearly as possible to their original appearance.

The Concrete Pit in this Building is Below Tide Water—But "ANTI-HYDRO" Keeps It Dry

Extreme conditions surround the sterilizing pit in this building. Unusual water pressure on the outside and acid fumes on the inside.

This pit is permanently hardened and waterproofed with "ANTI-HYDRO," which also protects the concrete from the deterioriating effects of the acid. In one operation "ANTI-HYDRO" hardens and waterproofs concrete and makes it acid, alkali and oil resisting.

Being a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the gauging water. No skilled labor is required. Results are *guaranteed permanent.*

Twenty-two years of successful use is your assurance of satisfaction. Use "ANTI-HYDRO" on your next job.

Lime is indispensable in construction. It has always been used; it is used today and it will be used whenever and wherever economical and permanent building is done. The extent to which it is used will always depend on how generally and forcefully its advantages are kept before the public. Certain properties are universally accepted, but many of the most important advantages of lime in the construction field are not fully appreciated.

Stucco, Plaster, Mortar and Concrete are the general divisions of construction into which lime enters, and a few of its advantages in each will be briefly presented.

Stucco

Stucco is fundamentally a covering to conceal and protect whatever method of construction is used. It must be composed of materials which withstand all weather conditions, and the proof that lime stucco meets this requirement is its universal use. The excessively wet climate of England has not effected it in hundreds of years. Germany knew no other stucco in the past and does not today. In hot, dry eMxico lime stucco is used exclusively today just as it was generations ago. The long cold winters of New England do not bother the lime stucco that has stood there for many years.

Lime stucco is adaptable to any type of construction from the small house to the largest office building as demonstrated by its use on the Sesqui-Centennial buildings at Philadelphia and on the fourteen story office building in San Francisco.

Also it is just as satisfactory on frame construction as it is on masonry; in fact it is often applied to both backings on the same building. On properly furred metal or wire lath lime will accommodate itself, to the inevitable settling and shrinking of frame buildings. The gradual hardening of lime over a considerable time avoids cracking on any acceptable construction.

The first or scratch coat is mixed somewhat rich in lime and with the proper amount of hair or fibre. It is applied as a heavy coat with sufficient pressure to give a firm key back of the lath. The pressure the plasterer must exert with lime stucco is less than with substitutes.

The first application is deeply scratched to give the best possible bond for the next coat. It is customary to allow the scratch to dry out for several days so that the stucco will develop its shrinkage and the building take the load. When all coats of a quick setting stucco are put on in quick succession the settlement caused by the weight of the stucco added to its shrinkage may cause unsightly cracks.

With lime the building is given time to gradually adjust itself while the three coats are being applied. There is no danger in rapid completion of a lime job after the first coat is partly set. The last two coats being light in weight and lean in cementing material are not subject to much shrinkage.

The addition of some gauging material is advocated and it may have some advantages, but many feel the use of too much will destroy the gradual adjustment of lime stucco.

The east with which lime is worked is probably its best known property, and nowhere is this advantage more in evidence than in the stucco finishes. Any desired effect of color or texture is obtainable,

*Presented before the Eight Annual Convention, National Lime Association, June 8 to 11, 1926, French Lick, Ind.

†Manager, Construction Department, National Lime Association.

and uniformity is assured for the plasterer is not hurried as when using a quick setting material.

In general, all large builders who have made a study of the economy and durability of stuccos are led straight to lime. This is true in Philadelphia, Columbus, and Minneapolis and there is no reason why a more general understanding of the problem would not increase the field. Lime is the original stucco material and it is the best today, in spite of the many attempts to prove up substitutes by high pressure methods.

Plaster

No use of lime is more important than interior plastering. Everyone knows that lime is used for plaster, but few have any conception of the fundamental difference between plasters. The rust resisting, fire retarding and sound insulating properties of lime plaster have been swamped in the flood of propaganda that has been put out in the last 20 years.

Whether wood lath or metal lath are used, the durability of plaster is dependent on the action of that plaster on metal. If the metal lath or the nails in the wood lath are not protected from corrosion, the plaster is liable to failure and occupancy of a building may be actually hazardous.

It has long been known that lime prevents rust, and in recent tests run at the Rock Island Arsenal it was shown that corrosion was absolutely prevented by lime, while rusting had started on similar specimens exposed to air. Specimens tested in another commercial plaster were found to have "corrosion well developed."

Microphotographs show clearly that on the specimen exposed to moist air, rust had started to spread from the impurities in the steel. The surface of the metal tested in the other plaster was very dark and proves conclusively that this material attacks metal when moisture is present. It is well known that corrosion once started never stops. Under the same conditions lime prevented the start of corrosion and if it does not start it will never cause a failure in a ceiling.

It is very important that plaster be a fire retardant. Fire departments are given the right of way over all other traffic in order that they may get to the fire before it has had time to spread. If that fire can be confined inside the room where it starts just a few moments longer by some certain plaster, that plaster will prevent many serious fires. Few conflagrations spring forth full grown, for almost every fire is small at the start and it is only the ones that are not confined that are serious.

Many tests have been made with plsat-their relative merits in the average starters under extreme fire conditions, but no comparative tests have been made to show ing fire. In—and perhapsthanks to—the absence of laboratory tests with the smaller fires, we must fall back on the practical experience of fire fighters for this information. Among the several fire chiefs that have stated their experience, Chief Alexander Henderson of Kansas City, Mo., has best put their opinion, writing: "My experience has been that in buildings containing lime plaster, fires were more easily confined to their place of origin."

Next, consider acoustics. We have control over our eyes so that we need not see anything we wish to avoid, but our ears receive sounds whether we wish to hear them or not. This shortcoming makes it very important that our partitions be good insulators of sound.

The relative merits of different wall plasters in respect to sound are very difficult to fix. We can see two lights at the same time and easily tell which is the brightest, but we cannot be in two rooms at once and sense which is the quietest.

The fact that buildings plastered with lime plaster were quieter and more restful has long been known, but the full degree of difference between plasters has not been realized.

Contract awarded Charles B. Keyser & Co., Bellaire, Ohio. Heating and plumbing, Alexander Zech & Son, Morgantown, W. Va. Electric, Rosenblatt & Hunt, Charleston, W. Va.

Albert Zellfelder, 1324 Walnut Street, Philadelphia, has opened a new department for the installation of Acoustic treatment of auditoriums, churches, assembly rooms, etc.; also for sound deadening in offices, machine shops, telephone rooms and other places where quiet is necessary.

An old legend tells of a magician's vase, the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

(Continued from page 440)

Recently, one phase of the problem of acoustics was investigated by the Bureau of Standards. Laboratory tests were made on many plasters to determine the extent to which sound would penetrate. Eight of the panels tested contained lime only and the tests show that in every case the transmission of sound was lowest with straight lime plaster.

In only three cases was direct comparison made between Gypsum and lime and the results show that actual sound penetrates hard plasters with 6 to 24 times the volume that it penetrates lime plaster.

These figures are only a measure of the transmission of sound from one room to another . They do not touch on absorption and reflection which govern the acoustics within a room. The value of lime plaster in insuring a quiet room or building is well established by experience, but its importance have been over-shadowed in the intensive advertising campaigns of other plasters.

The application of lime plaster has been made to appear very difficult and expensive. This is due largely to the fact that the true facts regarding its use have been submerged. In reality lime plaster possesses advantages over all other plasters that justify many of the largest builders in the country in using it exclusively.

The detailed work of plastering with lime need not be discussed except to bring out the fact that the best of keys—on which the strength of all plaster depends —are obtained. Another fact with lime plaster which is not realized is that the brown may be immediately laid on the wall over the scratch coat.

Plastering a ceiling—where metal lath is now the standard—is a simple operation with lime. The scratch coat is put on rapidly and easily, and it is followed immediately with the brown coat. If properly haired absolutely no difficulty is experienced with plaster falling off.

Attention should be called to the choice of metal lath. It is always desirable to choose a lath that presents the greatest bearing surface for the plaster. The best wall lath is not always suitable for ceiling work. A certain lath may carry wall plaster perfectly, but when this same lath is put on a ceiling—the bearing surface may be so reduced that the plaster will not stay in place. A little thought and study of this detail will go far to improve plastering in general.

Passing up the usual involved arguments and falling back on practical experience, the simple facts remain that lime plaster does not destroy but rather preserves the metal that always holds it in place; it retards the spread of a fire, and insulates against sound better than any other plaster. The largest builders in the

country use it for its economy, durability and ease of application. Lime plaster is suitable and also necessary for the finest work.

Mortar

The general public knows lime as something used to stick bricks together, and they are probably correct in that no brick or stone motars are successfully used, unless they contain lime. In the struggle for business much pressure is brought to bear to show the necessity of adding something to lime mortar. On the other hand, certain patent mortars that advertise "No lime needed" are known to add the lime in their plant, which makes the advertisement true. It may be necessary to adulterate lime mortar to keep certain competitive industries solvent, but it is not necessary for the sake of the mortar itself.

Independence Hall—over 150 years old—tells the story of durability just as well as going back to Babylon. The question of strength required is answered by considering that any modern house or apartment seldom has walls over five stories high. Modern office buildings, with their great height, do not depend on their masonry for strength, but rather carry their walls story by story on steel or concrete frames.

Even at the age of one day, tests at the Rock Island Arsenal prove that lime mortar does not show appreciable settlement at loads far above anything met in practice.

The principal material added to lime mortar is Portland cement, which adds unnecessary strength at the same time that it cuts down the workability. A little study of this question will reveal an increase of cost as cement is added that is out of all proportion to even the laboratory results obtained. In practice this unnecessary strength is seldom obtained because of poorer workmanship and also to the fact that the cement has probably hardened before it gets into the wall. Lime-cement mortars are satisfactory in spite of rather than on account of the added material. Even cement advocates admit that lime is required in all mortar as their specifications for straight cement mortar include a certain percentage of lime to make it workable; or in other words, the lime is added to make it mortar.

As an example, The West Baden Springs Hotel boasts of the largest dome in the world, with a span of 200 feet, or 12 feet larger than St. Peter's Cathedral in Rome. This dome supported on 16 brick piers is laid up in straight lime mortar without added cement.

Such examples of the use of lime mortar are scattered throughout this entire country. One and all these structures demonstrate beyond a doubt that lime mortar is all that a mortar should be. A general knowledge of the truth, the whole truth and nothing but the truth about straight lime mortar, would result in the saving of millions of dollars in the construction industry.

Concrete

The fact that lime is added to concrete by the biggest men in the construction industry is bound to raise the question as to why they do it.

Colonel Cooper specified its use in the Wilson Dam at Muscle Shoals, and it is specified in all Government work under the direction of the Chief of Engineers, U. S. Army. There is good and sufficient reason why such men insist that concrete on which they stake their reputations shall be as good in the forms as it came out of the mixer. Lime acts as a lubricant, facilitating placing and at the same time preventing the stone and grout from becoming unmixed on the trip from the mixer to the form. It insures an easier placed and more uniform concrete, which accounts for the water-tightness and the greater strength of lime concrete.

Caution says that "lime does not weaken concrete," but that is only a small part of the story. Structural or building concrete is generally difficult to work into the forms on account of small sections and heavy or complex reinforcing. Workability, or the ability of concrete to be worked into place, is obtained by adding either water or lime. Excess water reduces the strength while lime does not. It follows logically that if the required workability is obtained by lime and the amount of excess water is reduced, the concrete will be stronger. Field specimens prove that the use of lime does result in stronger structural concrete and friends of lime need not apologize for that fact.

The greater uniformity of concrete placed by the lime method is the direct and logical result of being able to move the concrete into place in the same condition that it left the mixer. Here again the specimens taken from jobs justify the use of lime because the designer is sure that there is no weak concrete at the critical points.

The improved appearance of lime concrete is also the result of its uniformity and workability.

We would naturally expect that the Chicago Plan Commission would use the most economical and dependable method of water-tightening the pits of their bridges over the Chicago River. Their letter on the subject says: "Ten pounds of hydrated lime per bag of cement was specified and used. The counterweight pits of all these bridges have proven to be absolutely watertight." At the Wells Bridge it is 34 feet from the water line to the bottom of the pits and they tell us these pits are absolutely dry. There is no mysterious property in lime that water tight-

A 355,000 Gallon Reservoir in This Building Is Waterproofed with "ANTI-HYDRO" Plaster Coat

What could be more convincing of the water-proofing qualities of "ANTI-HYDRO" than the fact that a plaster coat gauged with "ANTI-HYDRO" and water permanently water-proofed the huge concrete reservoir in this building? A smaller concrete reserve tank under this same building is also waterproofed with "ANTI-HYDRO."

"ANTI- HYDRO" is easy and economical to use. It both hardens and waterproofs concrete in **one operation.** Being a liquid integral agent, it mixes readily with the gauging water without the aid of skilled labor, and insures uniformly hard and waterproof concrete, through and through. Satisfaction **guaranteed.**

Twenty-two years of continuous use have established the permanency of "ANTI-HYDRO" results. Use it on your next job.

BRICK

TOADS

in brick language, are culls, bats, clinkers or lammies. In years past they went to the dump. Today many of them are being sold as Colonials. That is why prices vary so greatly on so-called Colonials.

A genuine Colonial will run from $30.00 a M for a Philadelphia Colonial or Antique to $50.00 for a hand-made, wood-burned New England Colonial. The difference in price is principally in the freight.

We are furnishing Colonials for many suburban schools and apartments. We shall be glad to serve you, too, if you want Colonials instead of toads.

As The Editor Sees It

PRACTICAL POINTERS ON GOOD CONSTRUCTION FROM THE MAN ON THE JOB

Due to powerful advertising campaigns on the part of the manufacturers of sevtral insulating materials, more thought is being given to this subject of insulation in connection with home building than ever before.

It is unfortunate that some of the manufacturers of insulating materials feel that they must condemn all the old basic materials in order to sell their product. However, there is little doubt that it will pay the home builder well to use an insulating material in certain parts of his construction.

The leakage of heat or cold through an 8-inch or 12-inch brick wall is exceedingly small. It is well known that the home enclosed in a brick wall retains the warmth on the inside in the winter time, that it keeps out the heat in the summer time. The brick house is always the most comfortable house, and the most economically heated. The claim sometimes is made that the frame house is warmer, and they offer as proof the fact that heat and cold penetrate a solid piece of wood very slowly. In fact you could have one side of a piece of wood blazing with fire and still hold your hand on the opposite side without discomfort. This is undeniable. The incompetency of this test, however, is that no house is built of one solid piece of wood. Frame construction consists of studding, set from 16 to 24 inches apart, with sheathing on the outside, usually paper outside the sheathing under the clapboard or siding, and on the inside of the studding lath and plaster.

The house when new and newy painted offers unquestionably, excellent resistance to low temperatures. But the difference between wood and brick is that wood shrinks and checks and cracks, that it separates at the joints, and the leakage in a new wooden home as compared with the leakage in an old one shows a wide variation. This leakage occurs in spite of frequent repair and repainting. It is this expense which throws the advantage of economy to the brick house, because the brick wall does not need repair or decoration.

The insulating materials are much more necessary in a wooden house than in a masonry house, but it is true that this insulating, even on the inside of a masonry house, reduces the leakage and probably pays for itself in comfort and in the saving of fuel.

However, the person building a brick home, a real masonry wall, need not worry about the leakage of heat or cold through the walls themselves. The points to be closely watched and carefully insulated are the windows and door openings, the floors and the roof. If the house is built without a basement it will pay the owner well to use insulating material under the finished floor and in every house, no matter what roofing material is used, it will pay well to use an insulating material on the under side of the rafters.

Go into your attic on a cold day and note the temperature. Also note the temperature on a hot day. The temperature of an unfinished attic will not vary much from the temperature outdoors. This makes the house harder to heat in the winter and almost impossible to keep cool in the summer.

No tests have ever come to my attention which conclusively show the relative insulating value of different materials. Some very extravagant claims are made in the advertising of the insulation manufacturers. These materials are usually made of some fibrous substance, and when

pressed together the sheets of boards contain myriads of small air cells, just as an ordinarily porous brick does. It is these infinitesimal air cells which form good insulation.

If your house is entirely enclosed with brick, we recommend at least that you use insulation around all openings and on roof and floors. If of any other material than brick, use it throughout.

Here are some interesting figures given by Howard F. Weiss in an article in a recent issue of *American Forests,* the results of tests made by him on heat transmission through the walls and roofs of dwelling houses:

Kind of Wall or Roof	Heat loss thermal units per hr. per sq. ft. per 1 degree F. transmitted through wall or roof. Uninsulated	Insulated	Saving in heat due to insulation (Per Cent)
Frame wall	0.267	0.179	32.9
Frame stucco	0.410	0.227	44.7
Brick wall, 8-in. thick.	0.351	0.207	41.0
Brick veneer, 4-in.....	0.235	0.161	31.6
Hollow tile wall, 8-in..	0.495	0.250	49.5
Wood shingle roof....	0.304	0.190	37.5
Asphalt shingle roof..	0.526	0.258	51.9
Slate shingle	0.422	0.231	45.3
Copper shingle	0.564	0.267	52.7
Zinc shingle	0.482	0.248	48.6

Building Economy.

GARAGE VENTILATION GAINING IN IMPORTANCE IN SHEET METAL TRADES

Building trades figures for the past six months indicate that there is a steady program of building construction, not only for private homes but in the industrial and business world as well. To secure advantages of this large construction program, the successful sheet metal tradesman is surveying the future possibilities of increasing his business.

A powerful and popular campaign is being waged against carbon monoxide, (automobile engine exhaust gas), that promises a further increase in business to the sheet metal trade. To best understand the application of this insidious poison to the industry, is to understand the action of carbon monoxide gas and the shortcomings in preventing its terrific toll.

For years health and government authorities, backed by physicians, nurses, and other powerful agencies have been educating the public against the dangers of this poison. This movement has apparently reached its height this spring with more than 20,000,000 automobiles registered in the United States alone and a contemplated 1926 production of 3,000,000 more.

While more than 65 per cent. of this huge total is kept in private garages, the remaining eight millions or more are daily stored in the public garage. And herein lies the application of this insidious poison to the sheet metal trade.

But relatively few of these public garages are equipped with adequate ventilating systems to eliminate this poisonous gas from the running automobile engines. Investigators have determined that from one and one half minutes to three minutes exposure is all that is necessary to cause death from carbon monoxide, showing the necessity for affecting the immediate release of this gas into the outer air.

But how does this affect the sheet metal trade?

In the first place, so great has become the sentiment broadcast by health propagandists that the general public is degandists that the general public is demanding the use of adequate ventilating systems to eliminate this poisonous gas from both public and private garages. The importance of proper ventilation precautions as a health factor in both the large and small garage is now more easily impressed upon the garage builder than ever before. Likewise, the popular sentiment of both private and commercial automobile owners is concentrated against carbon monoxide. From a purely business standpoint, this agitation is lending itself to the sheet metal trade in an increasing demand for more adequate

ventilating methods for the large garage, and will ultimately bring about a public consciousness for further applications to the private garage on the back lot.

The adaptation of improved ventilating systems to the public garage, when backed by the present concensus against carbon monoxide, offers not only increased business possibilities to the sheet metal trade, but it places the representatives of this trade in a highly commendatory light as assisting in eleminating the health hazards in his community.

EMPLOYMENT AT HIGH SUMMER PEAK: INDUSTRY SEES NO COMING SLUMP

Survey Made By the National Association of Manufacturers in All Parts of the Country Shows Unusually Healthy Condition for the End of June

"The industry of the nation is running on an astounding curve of eighty-four per cent of its maximum employment capacity and unemployment is practically nil," declared John E. Edgerton, president of the National Association of Manufacturers, in announcing the result of a nation-wide immediate survey of manufacturing plants in thirty basic industries. "This is an unusually healthy summer status; there can be no slump or panic," he added.

The Association sent out questionnaires to more than 3,000 members of its organization in pivotal sections for an instantaneous reflex of the business situation. Replies were received from 2,005 companies in thirty basic industries, and these reported that the number of employes required in their plants to maintain maximum capacity was 1,675,180, an average of 835 per company; and that they now have under employment 1,407,708, or an average of 702 person per plant.

"When the industries of the nation are running eighty-four per cent of their maximum employment capacity at the end of June, there certainly seems to be no ground for pessimism," continued Mr. Edgerton. "We are now at the time of the year when there is supposed to be a slump in production, a slump in employment, and a slump in wages. But our survey shows not a single one of these relaxing phases of industry.

"We hear reports from various sections that sales have diminished somewhat and that the values of the sales have dropped; but the fact that our production is keeping up almost to a maximum winter load, would indicate that the sales situation is one of postponement rather than permanent decline. Diminished sales is the rule in the summer and we do not see anything to indicate that the present situation is anything more than the normal dropping of interest of the consuming public and pressure of the sales forces.

"Indeed, our survey refutes the statements of the pessimists who all through the year have been predicting the panic that has not come; and unless it comes within the next fortnight, certainly will not be on us this year, at any rate. I believe industry in particular and the country as a whole have every reason to rejoice in this healthy situation of employment."

The survey was general, and covered all the following basic industries: automobiles, agricultural implements and supplies, automobile accessories, building materials and supplies, cement and clay industries, chemicals and drugs, clothing, electric, food and food products, furniture, glass, crockery, and porcelain, iron, steel, jewelry, leather, lumber, machinery, metals, paints, oils, paper and pulp, plumbers and steam fitters supplies, rubber, stationery, printing and books, textiles, tools, hardware, toys and novelties and the miscellaneous groups.

FORECAST STRENGTH OF CONCRETE

"How does concrete harden?" is in itself a simple question. But most people in answering this query would declare that concrete hardens through drying. Likewise when the question is asked as to how paint forms a protective coating the answer will nearly always be that paint hardens as it drys.

However, both paint and concrete becomes of material value, not through drying, but through chemical actions which take place within the paint or the concrete itself.

This fallacy in regard to the setting or hardening of concrete has led many to believe that the amount of mixing water used in making concrete is unimportant. In reality the amount of mixing water controls the strength of the concrete, in fact, so much so that scientists have recently worked out specifications whereby the strength of the material may be predetermined simply by regulating the amount of water as compared to the quantity of cement.

Too Much Water Weakens Concrete

Consequenty when water is haphazardly poured into the concrete mix along with the portland cement, and fine and coarse aggregate, good concrete will be largely a matter of chance. Imagine a cook carelessly dumping dippersful of water into his bread batch! Yet this is comparable to the way some people make concrete.

The pre-determination of concrete strengths through the use of varying amounts of water is known as water-ratio method. Professor Duff A. Abrams of the Portland Cement Association Research Laboratory supervised hundreds of thousands of tests before final specifications were issued. These of course require that the aggregate be sound and durable and that the mix be plastic and workable. Otherwise the strength of the concrete is determined by the proportion of mixing water to cement.

Water Ratio Coming Into Use

Among others, these noteworthy structures were built with water-ratio method: the Big Four Railway bridge near Sidney, Ohio; the University of Pittsburgh stadium; and the anchorages of the Camden-Philadelphia bridge. The Portland Cement Association on May 1 this year moved into its own home in Chicago, a structure built in accordance with similar specifications.

Concrete investigators have shown that under the water-ratio plan, uniform strength is assured, regardless of changes of workability or in the sizes of the aggregate. In other words the strength of the concrete is definitely known and a uniform concrete strength throughout a single structure may be obtained.

For ordinary work, the proper amount of water to use in making concrete is the smallest quantity which will give a mix of good workability. Builders in general should use as "dry" a mix as practicable.

Mixing Time Important

Another important point in the making of concrete is the thorough mixing of the materials. Concrete should be allowed to remain in the mixer for at east a minute. Most state highway commissions require at least a minute and a half for mixing. The speed of mixing is not so important as the time of mixing, for the materials must be thoroughly blended to form a good concrete.

Dusty or dirty sand or gravel or crushed stone aggregates will not make a strong concrete. The sand and pebbles must often be washed as well as screened to get rid of clay and organic material. Organic impurities are especially harmful, as they rob the cement of much of its strength.

Although concrete should be mixed and placed in the forms as dry as possible, it requires frequent moistening to cure it properly. In highway building, for instance, a new concrete road is flooded with water for 10 to 14 days, or is kept moist by a covering of damp earth or straw.

Yet, after all, good concrete making is as easy, and surely as desirable, as good bread making.

A GROWING DANGER TO THE BUILDING INDUSTRY

By O. W. ROSENTHAL, *President, O. W. Rosenthal-Cornell Co., Builders, Chicago*

Building material dealers and contractors alike generally oppose government in business because it threatens their own business.

In addition they have another objection which is still more fundamental. They object to their government, their America, gradually being forced into a state of communism. They do not believe the business of building or supplying building materials a proper function of government. They are convinced that the growing tendency of the government to enter the field of private business is a step on the way to communism, which, if carried out to its logical conclusion, would finally destroy *all* private business.

Threatens Dealer's Business

The attempt on the part of bureaucrats, to discredit business, to create the impression that government employes can produce or distribute more efficiently and economically than those of proved ability and judgment, is absurd, and yet as absurd as it may seem to those who really know the truth, it is fast becoming a menace to the nation and to private business.

Those charged with the responsibility for these bureaus and departments can point to no such record of progress as achieved by industry in private enterprise, where the conservation of capital and the producing of profits are primal considerations. They have not upon their own responsibility and initiative met the competition of those who have built up great industrial and commercial enterprises thru unusual ability. They have nothing at stake.

There are few cases in which one of these government employes has invented or initiated anything to more efficiently or more economically produce or distribute. Their contribution to the industrial world is almost nil, and yet by the use of inventions and methods devised by those who have their entire fortunes at stake—those who are constantly alert to every possible economy and added efficiency that they may properly, efficiently and economically serve the public—these bureaucrats and others would discredit private business by giving out the thought that they can produce more economically and efficiently and that business is not playing fair.

Public Deserves Bids

The public is entitled to competitive bids on a fair basis on all the government's requirements, whether it be materials, manufactured articles of construction, whether it be ships, lumber or envelopes. Private business has the same right in fair and open competition to serve the government as it has to serve private interests, and it can do this more efficiently and more economically than the government.

President Points to Dangers

If these governmental departments will revise their system on costs and accounting, the result of their efforts to compete would be startling by comparison. These bureaus could never meet the competition of private business if their charges were properly made.

I do not believe the public realizes the extent to which those who are entrusted with its affairs have plunged them into this communistic program; nor do I believe that the present administration is at all sympathetic to such a program. I quote President Coolidge, before the New York State Chamber of Commerce: "When government enters the field of business with its great resources, it has a tendency to extravagance and inefficiency, but having the power to crush all competitors, likewise closes the door of opportunity and results in monopoly." And again:

"I favor the American system of individual enterprise. When the government really starts into a line of business, that door of opportunity is closed to the people. It has always been an *American* ideal that the door of opportunity should remain open."—*Universal Dealer.*

A 355,000 Gallon Reservoir in This Building Is Waterproofed with "ANTI-HYDRO" Plaster Coat

What could be more convincing of the water-proofing qualities of "ANTI-HYDRO" than the fact that a plaster coat gauged with "ANTI-HYDRO" and water permanently water-proofed the huge concrete reservoir in this building? A smaller concrete reserve tank under this same building is also waterproofed with "ANTI-HYDRO."

"ANTI- HYDRO" is easy and economical to use. It both hardens and waterproofs concrete in **one operation.** Being a liquid integral agent, it mixes readily with the gauging water without the aid of skilled labor, and insures uniformly hard and waterproof concrete, through and through. Satisfaction **guaranteed.**

Twenty-two years of continuous use have established the permanency of "ANTI-HYDRO" results. Use it on your next job.

As The Editor Sees It

"STOPPING FIRES DUE TO CHIMNEYS AND FLUES"

The fact that the second largest cause of preventable fires in "defective chimneys and flues" is of especial importance to every home owner and occupant. Because these are classed as preventable causes indicates, as it quite true, that new chimneys and flues should not be defective and can be properly built.

There are three principal ways by which chimney fires are caused. The first is due to faulty or inadequate construction without flue linings. The second to providing for the connection of more than one apparatus to a flue. The third is due to the flue being too small for its intended use.

The first condition is unfortunately far too common. the second accounts in part for the numerous fires which always accompany a severe cold spell, and the third was much in evidence in certain localities during the last coal strike when flues intended for burning anthracite were used in connection with other fuels.

D. Knickerbacker Boyd, Architect, in the current Quarterly of the National Fire Protection Assn. makes some pertinent comments on prevailing methods of chimney construction and offers suggestions for remedying conditions. In investigations made in over one hundred cities, he says, "the conditions were very illuminating and quite astounding as evidencing the lack of uniformity in chimney requirements of the different places. Twenty cities allowed only one connection while 44 cities allowed any number at all to each flue. Others allowed two, three, four, seven, one per floor, one per family and so on. The National Board of Fire Underwriters and other authorities recommend only one connection to each flue.

On the other hand, 75 cities required flue linings as against 15 which did not require this recognized protection, although fire clay flue linings as recommended by the National Board are only definitely stipulated in 23 of these codes. Gas appliances are required to be vented in 50 out of 91 codes, but only 28 require that a masonry flue be used. This investigation indicated that building codes are not as strict and the provisions are not as careful as they should be."

However, as Mr. Boyd states, "even though the provisions are lax, the entire responsibility cannot be placed on the building codes, as there are other factors which have an influence on actual construction. It is impossible for building inspection departments, as they are usually constituted, to supervise constantly all details of construction. Far too many houses are built without architects or supervision of an architect's office. Very often the workmen are not experienced in chimney construction and so, even when properly designed, specified and "coded" the completed chimney may be defective."

The contributory causes of fires due to chimney as he points out, "can therefore be attributed first to lack of proper building code requirements and secondly to actual construction methods. By specifying proper construction architects can help, by insisting on good workmanship the contractor can do his share, and by giving careful attention to actual construction the bricklayer or mason can accomplish his part in securing correct results." After giving these matters careful consideration, Mr. Boyd comes to the conclusion that the way to ensure sound chimney construction is through somewhat drastic methods by insisting beforehand that all chimneys shall be tested on

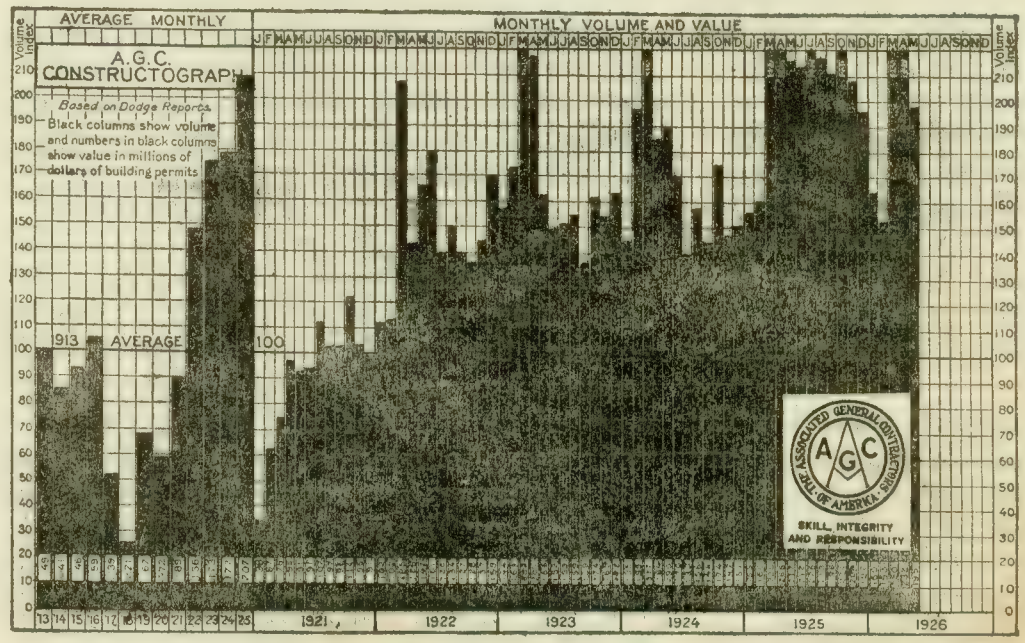
Recent developments in the construction industry virtually assures fulfillment of forecasts that the amount of building operations to be handled this year will be as great or greater than the record-breaking volume established in 1925.



The total volume of contracts awarded during the first five months of 1926 exceeded by fourteen per cent the figure for the corresponding period of 1925, according to statistics compiled by the Associated General Contractors of America. The total number of building permits issued during the first five months of this year is only slightly below the mark set in the same months of 1925.

While the volume of contracts awarded and the number of permits issued during May both were somewhat lower than the levels reached in April, the actual amount of construction under way in June set a new record for that month. This June figure was only slightly below the highest mark on record for any month and promises to be exceeded in July.

Reinforced concrete, steel, brick, hollow tile, 2 stories, 221x121 feet, slag roof, cement floor, flat slab construction, steam heat, electric light, plumbing. Contract awarded Mitzel & Shields Co., Cleveland, Ohio.

Shrine Chapel of Our Lady of the Rosary, Syracuse, N. Y. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Dominician Sisters of the Perpetual Rosary, Syracuse, N. Y. Brick, hollow tile, 47x161 feet (heating reserved), electric light, felt an dtile roof, wood floors, plumbing. Contract awarded Frank A. O'Hara, 287 Madison avenue, New York.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Low bidders:

Contract No. 68, Cedar Neck School towards Milford, 2.10 miles. Highway Eng. & Const. Co., Selbyville, Del., $15,231.

Contract CN33, Townsend-Dexter's Corner, 4.2 miles. Kirk Brothers, Upper Darby, Pa., $34,540.

Contract CS54, Harbeson-Indian Mission, 4.71 miles. Highway Eng. & Const. Co., Selbyville, Del., stone $109,030.50, slag $103,893.

(Continued fro page 471)

completion to determine whether or not they are tight.

As he says, "if the mason contractor knows that he will not be paid until all flues are tested and proved tight, he will take extra precautions to see that all his workers understand that condition, and they in turn, realizing what it will mean to them to make it good if their work is defective, will take additional pains to do it well."

Most of the things mentioned by him, as he further states, "are known to and observed by the best bricklayers, but there are many others less experienced who have not given as much thought and attention as they should to the importance of safe chimney construction. For the latter's work a test is imperative. For the good bricklayers such tests would prove their fitness and afford protection against incompetent competition. Specifications frequently call for the heating contractor to test flues before connecting heating apparatus and to "report any leaky flues for correction"—but by this time the mason may have left the building and, as is often the case, the building itself may have been plastered or so far finished that corrections are both difficult and costly and so the conditions are tolerated n spite of the perpetual fire menace as well as the annoyance and added cost of heating."

Mr. Boyd goes on to suggest that all specifications for building construction contain a clause under "masonry work" requiring that before the scaffolding is removed from around any chimney and before any chimney walls or breasts are plastered, but not until after the mortar has seasoned, each flue shall be given a separate and thorough smoke test by the mason contractor. Leaks into adjacent flues should, he says, "be especially looked for and not more than one flue shall be tested at one time, and any leaks which may develop shall be promptly made tight before the chimney work will be accepted as satisfactory.

He concludes with this statement—which is the crux of his recommendations, "Fires caused by electricity are classed as only partially preventable, yet with the widespread use of electricity it is not responsible for so great a loss as defective chimneys and flues. This can be attributed in part to the National Electric Code which regulates the installation of electrical wiring and appliances. But even of more importance in lessening the loss from this cause, especially in all new construction, is the further fact that all electrical installation must be inspected by organizations having jurisdiction and that a certificate must be issued by them before fire insurance policies will be written on the building. Why not the same provision as to every chimney built? The question then naturally arises, why not a National Chimney Code?"

"To design and build chimneys according to the provisions of such a code would be perfectly feasible. To inspect all flues and when found tight to issue a certificate to that effect and to make all insurance contingent upon such certificates is surely also but common sense. The Chimney Ordinance of the National Board of Fire Underwriters could serve as a basis on which a National Chimney Code could be drawn up and once it was prepared and recognized as authoritative, it could be put into force just as the Electrical Code now is. With the backing of fire underwriters, fire prevention organizations, architects, contractors, workmen and owners, it would not be long before the fire losses due to defective chimneys and flues would be practically eliminated with respect to new construction."

ANTI-HYDRO Makes Concrete Garage Floors Permanently Waterproof and Wearproof

The concrete floors and foundation of this garage are permanently hardened and waterproofed with "ANTI-HYDRO". The floors are so hard that they are not affected in the least by water, oil, greases or the wear from tire chains.

"ANTI-HYDRO" has been successfully used on every type of garage from the smallest to the largest. A floor in the Automobile Club of America building in New York, where cars are washed every day, is directly over the handsomely decorated ballroom ceiling. "ANTI-HYDRO" has so thoroughly waterproofed the one-inch topping on this floor that not a single drop of moisture has ever appeared on the ceiling below.

"ANTI-HYDRO" is a time and money saver. Being a liquid integral compound, it mixes readily with the gauging water without the aid of skilled labor. Twenty-two years of continuous use guarantee the permanence of "ANTI-HYDRO" results. Use it on your next job.

BRICK

TOADS

in brick language, are culls, bats, clinkers or lammies. In years past they went to the dump. Today many of them are being sold as Colonials. That is why prices vary so greatly on so-called Colonials.

A genuine Colonial will run from $30.00 a M for a Philadelphia Colonial or Antique to $50.00 for a hand-made, wood-burned New England Colonial. The difference in price is principally in the freight.

We are furnishing Colonials for many suburban schools and apartments. We shall be glad to serve you, too, if you want Colonials instead of toads.

As The Editor Sees It

CONSERVATION OF EYESIGHT

Much study and energy has been put to good account to provide efficient illumination of buildings by electricity. Most any effect is now available, but such illumination is always provided by artificial means.

Daylight is unquestionably recognized as the superior illumination for general purposes, and there is during daylight hours, so to speak, an unlimited amount of daylight available. But, things free and abundant are seldom recognized in their true worth.

Few have considered the possibility of making this daylight available to its fullest and most beneficial extent inside of the building. Of course some have considered it, and we see efforts being made in factory construction and in better arrangements of school windows, to get more daylight into the building, but unfortunately this has presented more serious problems. The wide variation of the intensity of light makes it necessary to provide a means of correction, so the variation of intensity of light on a dull day and that on a bright day are held within reasonable limits.

Working in this direction, some people have used awnings. Now awnings are too well known to need any discussion here. They provide certain comforts and conveniences that compel us to recognize their usefulness, but they exclude about two-thirds of the available light from entering the building. They are expensive, both in cost and in constant repairs. Where left to the public to operate they soon become very dilapidated and are a menace on a building. First because of a fire hazard which can be caused by a carelessly thrown match or cigarette. Second, from the possibility of being blown from their fasteners during a high wind and carried down on the street among pedestrians.

Venetian Blinds have been used to offset these disadvantages, and would seem to be a step further in the right direction. However, the Venetian Blind at its best can only deflect the light and that, in a rather inefficient manner. The Venetian Blind was originally designed for use in Venice to deflect the glare in the water toward the lower part of the room, very little consideration being given to the exclusion of the radiant heat of the sun. The Venetian Blind is also expensive both in cost, and in upkeep.

A third means, used extensively for factory buildings is to frost or paint the window glass. This for three very definite reasons is the worst thing to do, for a painted of frosted glass excludes a larger proportion of light on a dark day than it does on a bright day, and it is on a dark day that one needs all the light to be had. When the sun is on a painted or frosted glass, it does not diffuse the light efficiently, for pronounced glare is always apparent. A painted or frosted glass surface becomes an absorber of heat, and because of this actually contributes to conduct the radiant heat of the sun into such buildings when it would be most desirable to exclude it.

But before we go into such discussion further permit us by means of the following to show how important proper lighting is in regards to conservation of eyesight.

Conservation of Eyesight is a highly important subject and one which has attracted much investigation and research during the past few years by various organizations:

U. S. Bureau of Education, Dept. of Interior, Nat'l Committee for Prevention of Blindness, Eyesight Conservation

Council of America. The Peabody College of Nashville, Tenn., New York Illuminating Engineering Society, American Inst. of Architects of New York, and by many of the laboratories and research societies and institutions, eight societies in the State of New York alone.

As an indication of the accomplishment of this work, taking Boston for an example, the government report shows that the impairment of vision of school pupils was 31.50 per cent in 1907 and reduced to 12.86 per cent in 1916. The government also reports that 10 per cent of the rejects in the recent draft was due to impaired eyesight, which does not include minor defects which could be corrected with proper glasses.

We have before us a vast array of these digests from which we will attempt only a brief summary as follows:

The opinion is practically unanimous that the results are from the protracted and unhygienic use of the eyes in near work because of inadequate light during the period of their school life, the most prominent symptoms being a progressive development of near sight.

That the great majority of children enter the schools with a normal vision which is quickly impaired if the conditions of the school are improper, and that the number of short-sighted pupils is increased from class to class. The report of the Bureau of Education shows that the vision of 25 per cent of the pupils becomes defective.

An examination by the Department of the Interior of 1,000 school children from 5 to 18 years discloses the following percentage of refractive errors:

Hypermetropia (long sight)	36.2
Compound hypermetropic astigmatism	44.0
Emetropia	13.9
Myopia (short sight)	1.4
Compound myopic stigmatism	1.0

Refractive errors usually found in school children are hypermetropia and compound myopic astigmatism, the most common condition in early life being hypermetropia. Myopia conditions are seldom found in school entrants but develop with the advance in grades, so that it preponderates among children of the higher grades.

Concentration on near or far objects, as the case may be, by a near or far-sighted child causes eye strain, and if not relieved by proper lenses tends eventually toward blindness.

These digests devote much space to corrective measures—the color of the walls and woodwork, the absence of varnished surfaces and glazed paper, the lighting of blackboards and particularly to the diffusion of lighting.

They are unanimous in their recommendations that the windows should extend to about 6 inches of the ceiling and from 3 to 4 feet from the floor, because the light should always come from the upper part of the windows. They also agree as to the proper shading of the windows—a translucent window shade which will soften the glare when the sun is on the window, a shade which will operate from the top or the bottom and that the light should always be diffused from the upper part of the window. The Bureau of Education puts it tersely in these words: "The only entirely satisfactory device is the adjustable fixture whereby any desired part of the window can be covered."

To get the best results for illuminating buildings by the outdoor light the window glass should be as transparent as possible. There should be provided a fixture on the window that is adjustable to cover any area of the window necessary to reduce the light to an agreeable amount. This fixture should provide a means of diffusing the light to prevent glare. It should prevent the radiant heat of the sun from being communicated into the room. Since there are just three ways in which heat

Imperial Opera House Vienna, Austria.

WORLD FAMOUS STRUCTURES

THE Imperial Opera House is one of the most palatial edifices in Vienna, Austria. It is located on a beautiful boulevard in the famous Ring strasse belt. The architecture follows the lines of the renaissance period.

Five bronze figures in the balcony represent Heroism, Tragedy, Fantasy, Comedy and Love. The vestibule is richly embellished with frescoes and busts of celebrated composers, while the handsome staircase and rich interior decorations are inconceivable.

(Continued from page 488)

can be carried, by convection, radiation, and conduction, this fixture should establish definite control to prevent the radiant heat from being communicated into the room.

Thus the manufacturers arrived at the specifications of the Athey Perennial Shade which in its present state of perfection represents the most progressive and scientific improvement for the controlling of outdoor light to illuminate interior of buildings. This shade in effect follows the course of the sun, raises from the bottom, will lower from the top, eliminates all bright glare, radiates a translucent light, affords perfect ventilation, eliminates expensive awnings, is thoroughly waterproofed, dry cleans like new, will resist any wind pressure without rattle and in operation is never touched by the hand. It will wear for years and years and is adequate light. That most of the factors tending to cause eye strain exist in the school, being improper illumination, glare from windows, from glazed paper, and from improperly arranged artificial illumination, and it is an accepted fact that changes occur in the eyes of children during the most economical shade in the long run.

Unlike ordinary shade cloth Athey Perennial Shade cloth has no filling of chalk or clay to break or fall out causing unsightly cracks and pin holes to show in glaring relief against the outdoor light.

Dr. F. B. Dressler, who has devoted his life to the study of these subjects, is perhaps the best informed man we have. Formerly he was connected with the U. S. Bureau of Education, but is now with the Peabody College of Nashville, Tenn., although we understand that he still gives one-third of his time to the government.

Sometime since a representative called on Dr. Dressler with a full model of the Athey shade which he installed in a window. Dr. Dresslar at once said, "You need not tell me about it—it solves the trouble of eye strain, and I will now show you something which you perhaps have not thought of." He covered the entire window with the shade, seated our representative with his back diagonal to the window, handed him some fine print on glazed paper and instructed him to keep his eyes focussed on the page and pay no attention to his movemens. He then began lowering the shade from the top and when he had reached a certain point the vision was perfect. If you will try this you will find the result astonishing for this type of shade sets up a glow of perfectly diffused light, which reaches the remote parts of the room and makes available space that was formerly considered useless.—*Building Industry.*

WOODS—THE OAK RENAISSANCE

It is refreshing to observe the growing appreciation of architectural niceties on the part of builders of small homes for the market. No longer are homes built for, or by, the average American family, such plain, boxlike, purposeless affairs. Verily it would seem that our artistic consciousness has been awakened.

A feature of this awakening to architectural beauty is the pronounced interest in Tudor homes, or English Renaissance effects. And the popular preference for the charm and livability of the cottages of our English cousins, has naturally quickened interest in Oak—the dominant wood of the English Renaissance.

The outside Oak timber work achieves the effect of rugged, solid construction, the exposed Oak beams in hall, living or dining room, are truly reminiscent of the hospitable merry English homes of the 16th and 17th centuries, while the judicious use of Oak wainscot or panelling in the best rooms of the house, the Master's Room most particularly, add the ultimate note of good living and well being.

The word "Wainscot" is used advisedly as a contemporary of panelling, for wainscot in its strict application is Oak, and only Oak. It came into the English language from the Low Danish word "Wagenschott" which referred to a particularly fine species of Oak, imported from Denmark and much preferred in 16th century England for panelling. "Wanscot chairs," those priceless antiques, are merely Oak chairs of Tudor days.

Oak woodwork, notably Oak wainscoting or panelling, is stained to affect the mellow patina of time, a deep, rich brown, or bronze, known as "Antique Oak" or more recently in connection with furniture, as "Renaissance Oak." Golden Oak has no place in the modern, accepted use of this rich, rarely beautiful, enduring wood. Trim panelling and furniture are finished to harmonize with the modern flair for soft tones which incidentally happen to correspond with the deep brown of precious, time-hallowed Oak antiques of the old English halls and manors.

When one dwells on the rich history of Oak and its contribution to the immortal architecture of the Old World, it is difficult to realize that this wood of great tradition is so easily within the reach of the average income. Interest in other woods, has in a measure diverted attention of this generation from this superb hardwood, which in the forest is known as "The Monarch of the Woodland" and in its manufactured shape called by architect and artisan "The Sovereign Wood." It deserves more consideration in modern construction.

For panel work—and what is so rarely elegant and yet as reposeful as this character of finish, either expressed in the strict period spirit of Elizabeth's Era, or in the wide expanse of the latter day motives—Oak lends itself with effective charm. The "Mirrors" or figures in quarter-sawn Oak are lavish both in variety and abundance, permitting an endless decorative interest in the panelling, for each panel may have a distinctive pattern. Yet so subtle is this whimsical beauty of figure that the entire room or house can be joined together in an harmonious whole.

With growing interest in architectural purpose has come a parallel appreciation of the various periods and their appropriate materials. To be accurately reproduced, the English house should recognize the dominance of Oak during the period of its reign in English architecture. It is a wood that cannot be successfully counterfeited by the staining process, because of the rare distinction of its grain. Indeed, the attempt to do so, is to run the risk of a jarring note in an otherwise correct portrait.

In homes of modern spirit, Oak woodwork, doors, trim, moulding, stairways, etc., are enjoying renewed recognition because of the enduring, dependable qualities of Oak, its congenial air, and the ease with which it can be assimiliated into the general scheme of things, any color, any spirit.—*Keith's Beautiful Homes Magazine.*

ANTI-HYDRO Makes Concrete Garage Floors Permanently Waterproof and Wearproof

The concrete floors and foundation of this garage are permanently hardened and waterproofed with "ANTI-HYDRO". The floors are so hard that they are not affected in the least by water, oil, greases or the wear from tire chains.

"ANTI-HYDRO" has been successfully used on every type of garage from the smallest to the largest. A floor in the Automobile Club of America building in New York, where cars are washed every day, is directly over the handsomely decorated ballroom ceiling. "ANTI-HYDRO" has so thoroughly waterproofed the one-inch topping on this floor that not a single drop of moisture has ever appeared on the ceiling below.

"ANTI-HYDRO" is a time and money saver. Being a liquid integral compound, it mixes readily with the gauging water without the aid of skilled labor. Twenty-two years of continuous use guarantee the permanence of "ANTI-HYDRO" results. Use it on your next job.

As The Editor Sees It

SUBSTANTIAL AND ECONOMICAL CONSTRUCTION*

J. P. Mollenkof†

I have been wondering how you persuaded me to come here to try and tell you something about lime. I do not understand why you did not select someone who knows lime. First of all, I want it understood that I am not connected with any lime company and that the only reason I am using lime is simply because I want to use materials that are best and which I can buy at a price which will enable me to compete with other contractors.

The reason I have selected lime may be because my grandfather used it for mortar in building church steeples, and for stucco 75 years ago around Philadelphia and the jobs are still standing. My father also used straight lime in all his plaster and stucco 45 to 50 years ago and his jobs are still in good shape. Possibly their reason for using lime was that they had no other choice, as cement was out of the question in those days. However, when I can look back and see jobs standing for 75 years and more I often wonder why builders waste their time and money experimenting with every new material that comes along, pushed by a smooth-tongued salesman without any practical experience.

Some 12 to 15 years ago I started a collection of old stuccos and plasters, getting complete information as to how old they were, nature of aggregate, etc., etc. I now have specimens of stuccos, mortars and plasters dating back over 100 years. Quite a number of these specimens were plastered on hand-split lath, fastened with hand-made nails. When these specimens were taken away they were as good as the day they were put on. They are all examples of lime plaster, well sanded. You will note from the few samples I have here that the specimens are as hard as concrete.

The organization with which I am connected, John H. McClatchy of Philadelphia, has always been interested in giving the people the most satisfactory home that can be built for the price involved. This has, of course, necessitated considerable experimental work on our part in an endeavor to determine what materials were most suitable from the economical point of view, as well as the standpoint of durability. For stucco, plaster and mortar we have confirmed the fact that lime was the most satisfactory. In addition we have found that this material also served a useful purpose in precast work, and have made use of it accordingly.

Some six years ago the speaker was working with various concrete products. About that time we had considerable trouble with the stucco then being applied by various contractors. There seemed to be some difficulty in securing uniform and satisfactory results. It occurred to us that perhaps we could solve the problem by using a mortar mixer and deliver the stucco to the job ready-mixed. We tried it, and the indications were favorable. However, the mix then used did not seem to us to be the most suitable and we began to study the problem more intensively. While this study was under way with stucco we commenced to have some difficulty with plastering, which was then done by sub-contractors, and it also seemed a good plan to consider the problem of mason's mortar. The problem grew rapidly once we started.

---

* Persented before the Eighth Annual Convention, National Lime Association, June 8-11, 1926, French Lick, Indiana.

We tried practically every plastering material that was available. Some were hard to work, but set quickly. Some made a very easy working mix, but cut down the strength. Others gave high strength, but were hard to handle. We finally adopted lime and since then we have had practically no diculty in securing satisfactory and durable construction.

We decided to build a central mixing plant, and had to do it in a hurry, for the jobs were waiting for material. This was done. We installed a slacking system, consisting of a large slacking box about 30 feet long, 6 feet wide and 2 feet deep, in which a man can run off 120 bushels of lime per day without trouble. On the job we found that about 60 bushels was an average good day's work. With the large box we have our water readily available, four 1½-inch streams discharging into the box as needed. The lime is delivered close to the box so that the slacker can shovel it in without much effort and can handle the job without lost motion. From the box the lime is run through a screen into storage vats where it is allowed to stand until cold, a matter of three weeks under normal conditions. These vats are about 30 feet long, 5 feet 6 inches deep and 5 feet wide. After the lime is run off it is allowed to stand for two days and the water which rises is then pumped to a storage tank, to be used in slacking another batch of lime. The putty then lies for the balance of the three weeks without being disturbed.

From the vats the putty is moved to the mixers by wheelbarrows. We have found by experience that it does not pay us to try and pump the lime from the vats to the mixers. Two Blystone mixers are used, each arranged for independent operation, with separate sand storage bins, etc. The mixer is fully charged with sand while in motion, the necessary amount of properly picked hair and fibre put in, the lime added and the whole mass is then thoroughly mixed for about 3 minutes. The mixer then turns over and discharges into a waiting truck below. Four men operate the mortar plant, taking care of the slacking, moving of the lime to the mixers, sand storage, the mixing, hair and fibre picking and general work with a production of about 65 tons per day. This plant runs steadily every working day in the year. In fact, it is the only way that we can handle plaster and stucco jobs during the cold months. Construction naturally slows down to some extent, but even during the coldest weather we slack at least 60 bushels of lime every day. In fact, three years ago we lost only two days in zero weather, about one week was lost the year before last, and about the same time was lost last winter. We tried mixing on the job, but that did not work, and since we have been using the mixing plant everything has been much more satisfactory. We do not have trouble with waste or frozen plaster and we find that the work goes faster on the job. During the warm months we slack on an average of 150 bushels of lime per day so you see that our central mixing plant is a busy place at all seasons of the year.

Within a 5-mile radius of our plant we find that we can get ready-mixed plaster, and stucco on the job at a lower cost than can possibly be secured by even the most efficient field operation. We have far less waste and are assured of a uniform mortar at all times. It also increases the efficiency of the plaster, for they know exactly what kind of material to expect, and work steadily, note having to bother about retempering or other delays which are frequently encountered when field mixing is practiced.

For delivering mortar we use International trucks, with 1-yard special bodies designed to dump into mortar boxes. We found that pucture proof tires, either of the solid or perforated type, are absolutely necessary, for tire trouble must be eliminated.

The way to make the best stucco was our first problem after the central mixing plant had been developed. This involved

Hotel, 6-8-10 F street, N. W., Washington, D. C. Architect, E. L. Rothschild, Bankers' Trust Building, Philadelphia. Owner, Lawrence Gassenheimer, 2 F street, N. W., Washington, D. C. Reinforced concrete, brick, hollow tile, 7 stories and basement, 48x102 feet, cement and hardwood floors, electric light, elevators, rolled steel sash, tile work, steam heat, iron work. Contract awarded Baer & Scholz, Edmons Building, Washington, D. C.

(Continued from page 504)

a careful study of the materials available. We studied lime, cement, sand and special aggregates. We finally developed a specification which we thought was suitable and then the problem was to get sand which closely approached this specification, for it was, of course, impossible to get sand commercially that would meet every requirement and still be cheap enough to use. We have standardized on a local sand with satisfactory results. This we use for the first two coats. We purchase in large quantities and are able to get an attractive price because the dealer knows exactly how long it will take his trucks to bring a load to the plant and also that our storage is large enough to take sand at his convenience.

The common sand we use is the finer material from concrete sand, the largest particle passing a Number 8 screen and about 5% passing a 200-mesh screen. The approach to our plant is paved and this eliminates the danger of trucks getting stuck in the mud, which is a serious item in trucking costs. Naturally we benefit by this facility, which is not usually the case with sand deiveries direct to a housing operation.

Sand is used only in the scratch and brown coats of our stucco, as we find that a coarser material works better with the type of finish we use. For this finish coat we prepare our own aggregate by crushing Cape May pebbles, or "pea grit." These pebbels are extremely hard and break up very well in a roll crusher, set to one-fourth inch. There is a surprising small percentage of fines in this crushing and we have found by experience that screening is not necessary. This aggregate is very light in color and blends in with any of the colors we use to good advantage.

We always secure our stocks in large quantities. This applies to all materials used, and as a result we get a good choice. This is particularly true with respect to hair and fibre, which are important in both plaster and stucco. We use equal parts of hair and fibre, the hair running from ½ to 1½ inches long and the fibre from 2 to 3 inches in length. Both materials go through a picker which fluffs them up ready for use. The picking is done by the mixer operator in his spare time.

All our plant proportions are by volume, as we have found that method of proportioning to be the most satisfactory. For the scratch coat stucco, we use a mix of about 2½ cu. ft. of lime putty, 1 sack of Portland cement and 8 cu. ft. of sand, to which we add 1½ pounds of hair and 1½ pounds of fibre. For the brown coat, which must be leaner, we use 2 cu. ft. of lime putty, 1 sack of Portland cement, and 8 cu. ft. of sand. We find that in stucco it is not necessary to add any hair or fibre to the brown coat. In the finish coat we use 2 cu. ft. of lime putty, 1 sack of Portland cement and 8 cu. ft. of crushed aggregate, without any hair or fibre.

A great deal of our stucco is applied over frame construction. On this type of house the frame is first covered with a layer of rubberoid, which we have found to be better than the ordinary building paper which is usually applied. Over this, galvanized wire is applied, furred out with wood lath on 12-inch centers. This insures a good thick coat of stucco, protecting the metal and eliminating cracks.

When we apply the stucco to concrete blocks it is highly important that the surface be wet first. After the scratch coat is applied we let it harden and dry for at least two days. If the scratch coat has been put on frame construction, it is not necessary to dampen it before browning, but if it is on blocks, we find that it must be wet before the brown coat can be applied. This is because of the high absorption of the blocks.

The brown coat is applied to bring the surface out and even up the job. Before it has hardened, the finish coat is put on and worked into the brown. The finish most commonly used is a rough drag or scrape finish, made by dragging the edge of the trowel over the surface. This work is done by the average plasterer without special training and gives very satisfactory results. We use cream, salmon, buff and gey tins in addition to the pure white. For the tints, mineral colors (oxides) are used, and for the pure white we use white cement instead of the grey cement ordinarily used.

The story of our plaster is quite similar to that of the stucco, except that we use slightly different proportions. Both metal and wood lath are used in our houses, the wood usually on the side walls and the metal on the ceiings. We have found it more economical to use a stiff lath—about 3.2 lbs. per sq. yd.—for the ceiling work, than to use the lighter grades. The reason is that there is less dropping and the men can work faster over a stiff surface. We have never had any trouble from plaster falling from either ceilings or walls.

For the scratch coat our mix is: 8 cu. ft. of sand, ½ sack of Portland cement and 4 cu. ft. o flime putty and 3 lbs. hair and fibre, or a 1:2 mix.

The brown coat mix is: 8 cu. ft. of sand, ½ sack of Portland cement, and 2 cu. ft. of lime putty and 1 lb. of hair, or a 1:3.2 mix.

All our plaster work is doubled-up, or laid-off. That is, the brown coat is applied immediately after the scratch coat, thus ensuring an absolute bond between the two coats. We use a different mix for the two coats in order to reduce cracking and also to reduce the cost, but feel that a rather rich scratch is necessary, for upon it depends the integrity of the whole job. However, we do not find it necessary to get a special class of plasterers for this work, as we find that with lime mortar such as we supply to the plasters there is no difficulty in securing good work, with the proper supervision. Their work as well as the material is uniform, and we find the same kind of plastering is done in the afternoon as in the morning. The mortar is always smooth, uniform and easy working and does not "pull their arms out." Every man covers a good yardage each day and we use a high percentage of apprentices. We secure a good plastering, and we are not troubled with falling ceilings, bulged side walls, or cracking.

We have had complaints at various times from some plasterers about the use of machine made mortar. Some of them claim that they get a better and harder wall when the mortar is prepared on the job, but we have found that the machine made mortar is more satisfactory, both as regards durability and economy. It has been necessary to clean house a couple of times with both the plasterers and the hod carriers, but we have never experienced any difficulty in getting men to take the place of those who were discharged, as we give them steady work practically the whole year round. At one time we discharged 65 plasterers and filled their places within a few days.

When one considers that for the past four years Mr. McClatchy has been building about two houses every working day or between 600 and 800 per year —you will realize the problem that must be met in supplying the men with mortar for plaster and stucco. At times well over a hundred plasterers are on the various jobs, and never less than forty plasterers are working.

At first we supplied the brick and stone masons with their mortar, but we found that it was more satisfactory for our central plant to just supply the plasterers, where a high-grade mortar is absolutely essential, than to attempt to also make the leaner mortar used by the masons. In an emergency, of course, where a small amount is required, we send mortar out to any part of the job, made as needed for the work under way.

We have found that lime stucco and lime plaster are very adaptable. They are easily prepared, easily worked, easily colored. Any desired texture may be secured without difficulty, ranging from the smooth finish to special trowel finishes and color blends. The stucco we use can be made up in any conceivable fashion. The Home Electric, which we built for the Sesqui-Centennial at Philadelphia is a lime stucco job, finished with three-color Spanish-style stucco. The only change in our specification was in the colors used and in the special trowel work work on the surface. Those of you who plan to be in Philadelphia can see thousands of lime jobs in good condition.

THE BRICK HOUSE COST DELUSION

One of the most inexplicable puzzles of present-day construction experience is the reluctance of the average American to concede the economy of the brick home. Invariably he magnifies its first cost.

Europe has been a land of brick houses for many centuries. Hundreds of the older and usually titled families of England, France, and Italy, still draw dividends from brick houses built by their ancestors often as many as a thousand years ago.

Many a tourist returns from abroad to relate with enthusiasm tales of the pic-

turesquely beautiful old homes he has seen there. And seldom does he realize that they were built of common brick whose charm and appeal have only been enhanced by the mellowing effect of countless years of exposure to sunshine and storm.

The common brick is the Madame Recamier of all building materials, endowed with the rare and wonderful ability to grow old beautifully. In these remarkable Old World structures it has attained a dignified and venerable old age without reaching a state of decrepitude. It still stands staunchly and firm.

Its strength is burned in just as is its beauty.

Convincing and lasting beauty are not matters of money with the common brick. It is a most adaptable material. With it perfect taste and durability may be built into a cottage as easily and as cheaply as into the mansion of the millionaire.

Common brick are made today in almost every color and shade; in every degree of fineness and coarseness of texture. New types of wall, both beautiful in appearance and economical of construction, extend the range of their versatility. And incidentally very materially reduce the cost of the brick home.

More than ever before the architects and skillful bricklayers cleverly combine these vari-colored units in new and pleasing variations, just as an artist uses his paints, to create a surface with all the attractiveness of a master woven fabric.

Architects no longer hesitate to specify the common brick for the homes of their wealthiest patrons. Mansions built of this humble material dot the land. For the captains of industry and finance are finding common brick not only attractive but economical.

Many a man of average income has put aside forever his dream of a brick home through a mistaken idea of its cost. The fact is that any man who wants it may have a common brick home at a cost not exceeding six per cent. more than that of a frame house.

Within the next five years, through its inevitable natural economies, it will wipe out the difference between its cost and that of its nearest competitor.

And if the prospective builder will but ascertain how the best architects and builders regard common brick from the viewpoint of beauty and economy and fire safety and durability he will have nothing else.—*Building Economy.*

MOST CITIES NEED GREATER FIRE LIMIT EXTENSION

Lacking it they build only to increase the fire menace and the home owner's burden in taxes, insurance and depreciation

American cities are giving more attention at the present time than ever before to the matter of fire limits. A number of cities are waking up to the realization that they are all set for a magnificent bonfire. In many American cities the downtown business center, containing many so-called fireproof structures, is hemmed about with enough inflammable material to destroy even the best type of building once the match is applied. The burning of large areas for frame buildings produces a super-heated air which flows in currents and destroys whatever it touches.

Another very important reason directs attention to fire limits. The building up of large residential areas with a type of construction which produces a fire menace and at the same time depreciates rapidly is proving an increasing burden to the city's financing.

Many of these sections were good residence locations 15 or 20 years ago but, because all of the property was of the quick depreciating kind, values have gone down steadily, the old inhabitants have moved out, and two or three families are now crowded into a house that once was occupied by one family. Values have practically been charged off on the county duplicate, and these areas do not produce enough in taxable income to reimburse the city for improvements to streets, for lighting and policing and other public service.

W. R. Hopkins, city manager of Cleveland, in an address before the Chamber of Commerce of Cleveland, not long ago, called attention to this very situation as one of the big problems which the city has to face.

The extension of fire limits is the answer. If these same areas had been built up of sound construction, permanent materials, guaranteed against depreciation, they would not have gone down in character and become cheap slums. In many cases the original inhabitants would still be there and the property would be earning its way in the city budget.

Now comes the National Lumber Manufacturers' Association with the avowed policy of opposing extension of fire limits. In a recent bulletin to its membership this association said: "The effect of such legislation is to reduce the market for lumber and to increase the cost of building construction, since only masonry walled buildings may be built in fire limit areas." In another paragraph it says:

"The National Lumber Manufacturers' Association has made arrangements to send representatives at once to certain of the cities where conditions are reported as most objectionable."

Wherever opposition to the extension of fire limits appears it may be traced to the lumber influence. Every other interest in the city will be served by the extension of fire limits, and the lumber interest is more frightened than hurt.

The argument against the extension of fire limits, and the only one that can be used by even the most selfish opponent, is that it will increase the cost of building. It may increase the first cost of some buildings to require that they be built of masonry, but such regulation lowers the ultimate cost of all buildings. The masonry building is always the cheapest building in the long run, and the run doesn't have to be so long at that. A few repaintings and the annual repair bill on the other types of buildings quickly make up the difference in the first cost between masonry and frame.

The argument that fire limits add to the cost of building is not valid. Fire limits save money for the owner in three tangible ways. They save on the cost of the building ultimately, and that is what the owner is most interested in. They save him in depreciation and repair bills. They save money for everybody in the community in insurance and expense of fire protection.

There are no records to show that the average man, as a wage earner, in Philadelphia, or St. Louis, or Denver, or Salt Lake City or El Paso, has any great advantage over the average worker in any other city in the United States. Yet in these cities practically every family lives in a brick building. The lowest paid man in the cities, if he has a home at all, has a brick home, because there are no other kind.

The fact that these cities, and many other smaller cities in the United States, are built up almost exclusively of brick homes, certainly takes the wind out of the sails of those who argue that good construction puts a hardship upon the small home builder.

Chicago, which was originally a frame city, is continually adding to its fire limits, until today the greater part of the city excludes inflammable construction. St. Louis and Denver for many years have had restrictions against inflammable construction. Many other cities, including Salt Lake City, simply built well from habit, the pioneers having set the example. The habit of building with brick has long existed in Philadelphia, Baltimore and Washington. Still these cities prosper. They have smaller fire losses and the wage earners live in safe homes.

The only valid objection that anyone can raise to an extension of fire limits within a city is that it will lessen the sales of lumber. It will make the forests last a little longer. It will tend to slow up the advancing prices of lumber so that for a few more years it will be available to the builder of moderate means for interior trim and framing of his home. Extension of fire limits puts a city in the path of lower insurance rates, reduced cost of fire protection, and reduction of the great economic waste from depreciation and from fire loss.—*Building Economy.*

"The Oldest American Fire and Marine Insurance Company"

We Call It Tourist Baggage Insurance

but it applies to a week-end trip as surely as it does to a whole year of travel.

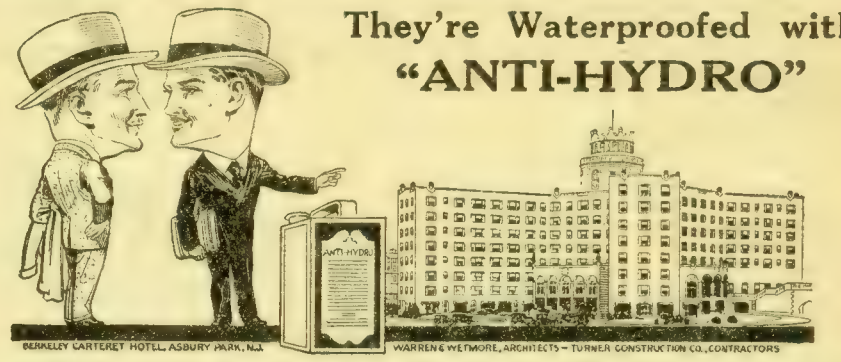
Tourist Baggage Insurance protects you from loss on your investment in baggage that is lost, damaged or stolen on trains, in the hands of transportation companies or in hotels.

Tourist Baggage Insurance is one of the most inexpensive forms of property protection we offer—and very practical protection at that.

Your agent or broker can get you a North America policy.

Insurance Company of North America

PHILADELPHIA



and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

Driving Rains and Salt Sea Air Cannot Penetrate or Stain These Brick Walls—

They're Waterproofed with

"ANTI-HYDRO"

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete **permanently.** Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

As The Editor Sees It

WHERE LARGE INVESTMENT IN HEATING PROVED A MANUFACTURING ECONOMY

Why a forced hot-water system was chosen for Ford's new plant at St. Paul

By E. H. WHITTEMORE,

Stone and Webster, Incorporated, Boston

Reprinted by special permission from "Factory," the Magazine of Management

In the modern manufacturing plant, whatever the character of the finished product, there is nothing more important in connection with the general design than thorough consideration of the proper assignment of space for equipment and machinery. Whereas this has already become the function of a profession more familiar to this generation than to the last—efficiency engineering—it must always of necessity be uppermost in the minds of those responsible for the design of heating, ventilating, and other building service systems.

In a plant similar to the one recently erected by the Ford Motor Company at St. Paul, Minnesota, and used both for the manufacture of parts and for the assembly of automobiles, several systems of heating suggest themselves as being capable of producing the desired results. After much consideration and careful study, it was decided that a forced hot-water system using direct radiation in the form of pipe coils and wall radiators would prove the most desirable. The wisdom of this decision might be questioned by many because of what might appear to be excessive first cost, but when all other factors are taken into consideration, particularly when it is realized that such a system does not occupy any space required for the most efficient arrangement of machinery and manufacturing equipment, and also that the maintenance and operation of the system costs considerably less, the reasons for its use become more apparent.

The building itself is of unusually large dimensions for the one-story-monitor and saw-tooth type, having an overall length of nearly 1,400 feet and being 600 feet wide. Except for a relatively small section in one corner, and an electrical substation near the center, the entire structure is one large room. There are 327,740 square feet of glass surface, the greater portion being in the roof construction. A wide range of building material was used, varying from plain brick walls to cement-tile roofing, and a wide range of heat-loss factors was used in the design computations.

The entire scope of the problem presented in the design of this heating system cannot entirely be appreciated until it is realized that temperatures as low as 30 degrees below zero have occurred in this locality, and since the building is located on a high bluff above the Mississippi River, there is a general exposure to strong winds.

The greater part of the radiation is in the form of one-and-one-half inch pipe coils of the miter type, suspended horizontally above the bottom chord of the roof trusses, thus affording the maximum amount of clearance throughout the entire building for the installation of manufacturing equipment and machinery. While this may seem to be an inefficient location for radiation of this type, as it would be in the more common type of multi-story building, the natural air current circulation in a building of the type of the Ford plant is such as to afford satisfactory natural heat distribution throughout the building.

Wall radiators have been installed on the exterior walls below the windows, in the usual manner.

Direct Radiation Reduced in Showroom

In the office section of the building both wall and column-type radiators were used, as in the ordinary installation for such service, with one exception, however. On the extreme northwest corner of the building is located a showroom having unusual glass areas for the purpose of merchandise display. In order to eliminate much of the required direct radiation from this room, unit heaters were installed in an adjacent room. Air is heated and recirculated through grilled openings in the intervening wall.

The great length and symmetrical design of the building afforded an opportunity to design the piping system in such a way that an unusually efficient system of water circulation was obtained. This feature alone often becomes the critical point in the design of any forced hot-water heating system. Conditions at the Ford plant were particularly favorable to the design of this part of the installation, since pipe runs could be made straight for nearly their entire length, thus reducing friction to a minimum, and since both coils and radiators could be so proportioned in size as to produce the desired friction load to assist in equalizing the entire circulation of the water.

When it is considered that the amount of coal required to supply the amount of energy necessary to warm this building during the normal year would be sufficient to meet the entire demands of a fair-sized community, it is only natural to endeavor to effect every possible economy. This thought has been uppermost in the minds of the engineers in designing the boiler plant. The original heat energy is generated in the form of steam. Water-tube boilers are used, burning powdered coal; and turbine-driven electric generators have been installed as a standby supply for power service. Steam is bled from these turbines at the 10-pound stage. Steam mains carrying this pressure and other mains with full boiler pressure are carried across an enclosed bridge and through a concrete tunnel running underneath and across the entire width of the building. The tunnel is also used for coal-conveying equipment, fuel being unloaded from railroad cars directly into a hopper, feeding the conveyor which carries the coal to the power-plant.

Pump and Heater Room below Floor

A pump and heater room is located below the floor, near the center of the building and adjacent to the pipe tunnel. This room accommodates two low-pressure closed heaters, two high-pressure closed heaters, one motor-driven and two turbine-driven centrifugal pumps, one turbine-driven and one motor-driven condensate pump, two expansion tanks, an air compressor, and the necessary control pipe and valves for the operation of this equipment. The low-pressure heaters ordinarily used are of 500 gallons per minute capacity, based on raising the temperature of water from 170 degrees to 200 degrees Fahrenheit when supplied with steam at 5,000 pounds gage pressure. One high-pressure heater of the same capacity has been so connected into the piping that it may be used as a low-pressure heater, should one of the others be out of commission; or as a booster heater, should it be found desirable to raise the temperature of the water above that of normal operation. The other high-pressure heater is designed for use whenever it is desirable to operate the heating system for the office section, independently of the other portion of the building. The low-pressure heaters have cast-iron shells, while the high-pressure heaters are of steel, all being of the horizontal type with tubes of seamless drawn copper.

The main circulating pumps, two of which are steam-turbine driven and one motor-driven, are of 5,000 gallons per minute capacity each, whereas a separate steam-driven and a motor-driven pump have been installed for independent use of the office section. Pump turbines are designed to operate at 125 pounds gage pressure and 25 pounds back pressure. Electric motors are of the constant-speed type, operated at 440 volts, three phase, alternating current.

To handle the condensation from the heaters, a receiving tank has been installed, having in connection with it one motor-driven and one turbine-driven condensate pump. These are of the same type as the circulating pumps, with a capacity of 450 gallons per minute, and a discharge head of 28 feet. From these pumps the condensate is delivered to a large surge tank located in the steam station, which also acts as a storage reservoir for condensate collected throughout the entire boiler-plant. From this storage reservoir, condensate is fed directly to the feed-water heater by gravity.

The main expansion tank is 10 feet in diameter and is 15 feet long, having a capacity of approximately 9,000 gallons, being built of black steel with dished heads. This tank is buried beneath the

Residences (2), Woodlawn, Wilmington, Del., $12,000. Architect, private plans. Owners, Joyce & Kerrigan, 1021 West Fourth street, Wilmington, Del. Brick, 2 stories, 21x32 feet, slag roof, pine floors, steam heat, electric light. Owners will build.

Residences (2), Sixteenth street, Wilmington, Del., $12,000. Architect, private plans. Owners, Joyce & Kerrigan, 1021 West Fourth street, Wilmington, Del. Brick, 2 stories, 22x32 feet, slag roof, pine floors, steam heat, electric light. Owners will build.

Residences (18), 600-22 West Twenty-eighth street, Wilmington, Del., $6,000 each. Architect, private plans. Owner, Charles P. Witsil, 2523 Jefferson street, Wilmington, Del. Brick, 2 stories, 29x38 feet, slag roof, pine floors, hot water heat, electric light. Owner will build.

Residences (4), Claymont street, Wilmington, Del., $4,000 each. Architect, private plans. Owner, Luigi Fortunato, 1710 West Ninth street, Wilmington, Del. Brick, stone, 2 stories, 28x37 feet, slag roof, pine floors, hot water heat, electric light. Owner will build.

Road Work, Delaware. Owners, State Highway Department, Dover, Del.

Contract 69, Harrington-Mastens Corner, 2.46 miles, Sec. A. Contract 69, Big Ash-Warren's School, 2.40 miles, Sec. B. Clearing, grubbing, excavation, borrow, broken slag base course for secondary roads, corrugated metal pipe.

Contrace 70, Elkton Road-Pleasant Valley School, 1.487 miles. Excavation, borrow, broken slag base course for secondary roads, corrugated metal pipe, creosoted timber for bridges.

Contract 71, concrete widening, Cheswold-Smyrna, 4.84 miles. Excavation, cement concrete pavement, asphaltic expansion joint, Class "A" concrete gutter.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Low bids on work received August 11th.

Contract CN30, Richardson Park-Lancaster Pike, 1.68 miles. W. W. Truitt, Lincoln City, Del., $57,450.50.

Contract CN31A, Rogers Corner-Eden Park, 0.80 mile. F. W. Lovett, Newark, Del., $24,-430.50.

Contract CS55, Selbyville-Williamsville, 4.2 miles. Highway Eng. & Const. Co., Selbyville, Del., $86,158.

Miscellaneous Contracts Awarded

Restaurant and Office Building, 225-27 West Forty-second street, New York. Architects, The Stuckert Co., Crozer Building, Philadelphia. Owners, Bickford's, Inc., 156 West Seventy-second street, New York. Brick, steel, 2 stories and basement, steam heat, electric light, tile and marble and terrazzo work, brass dipt floors, bronze work, plumbing, architectural terra cotta, metal bars. Contract awarded Kuhn, Smith & Harris, 461 Eighth avenue, New York.

(Continued from Page 520)

floor of the building, with one head and a small portion of the shell projecting into the pump room. A similar tank of smaller capacity was installed for use when the office system is running independently. A small motor-driven compressor, having a capacity of 17 cubic feet a minute, at 100 pounds pressure, has been installed to maintain the necessary air pressure on either tank.

In the list of several advantages to be found in the use of a system of this type in a building of this character is the great economy in operation. A wide range of temperatures easily obtainable through the flexible arrangement of con-

trol offers an advantage not easily obtained in any other system. As a result of this flexibility of control, it is possible to maintain a more even temperature throughout the entire building at all times, thus affording maximum comfort and maintaining healthful conditions.

A COMPLETE MANUAL OF CONCRETE HARDNER AND WATERPROOFING SPECIFICATIONS

A Manual of Concrete Hardners containing detailed architectural specifications for all approved types of Hardners, both integral and surface treatments, and both colored and uncolored, has been compiled by the Master Builders' Company and published for Architects, Engineers, Builders and Building Owners. The book is loose-leaf in form, of file size, 8½x11 inches, with pages indexed, enabling the reader to turn directly to the specification without having to thumb through pages of data and descriptive matter.

This is a complete manual of Concrete Hardner specifications with illustrated descriptive matter arranged systematically and including specifications so worded that they can be incorporated in a general paragraph or in detail into building specifications.

Compiled by the originators of the principle of hardening concrete, the information contained in these manuals is based on sixteen years of experience in this specialized field of building construction, in the laying of concrete floors of all kinds in buildings of practically every type.

A second book of the same size covering Master Builders' Concrete Waterproofings has the same unique and convenient arrangement of contents.

These manuals were described by one architect as "containing the truth, the whole truth and nothing but the truth, and as easy to refer to as the telephone book!"

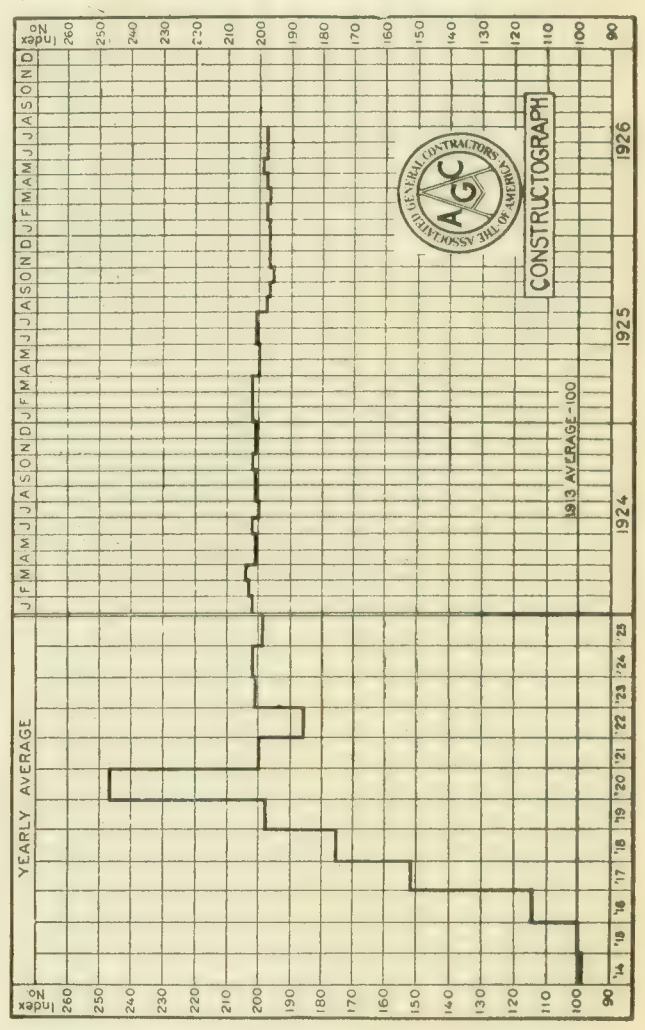
Both books are supplied free upon request by the Master Builders' Company, Cleveland, Ohio.

All records for volume of construction in the United States were shattered in July. Never before was so much money expended in a single month for labor, materials and other elements entering into building costs, according to statistics compiled by the Associated General Contractors of America.

The volume of construction handled last month was well above that recorded for August, 1925, when the previous "peak" was reached. The index on construction operations, based on the 1913 average, shows a jump from the March level of 120 points to the present position of 229. This is the greatest increase within a four-month period ever recorded.

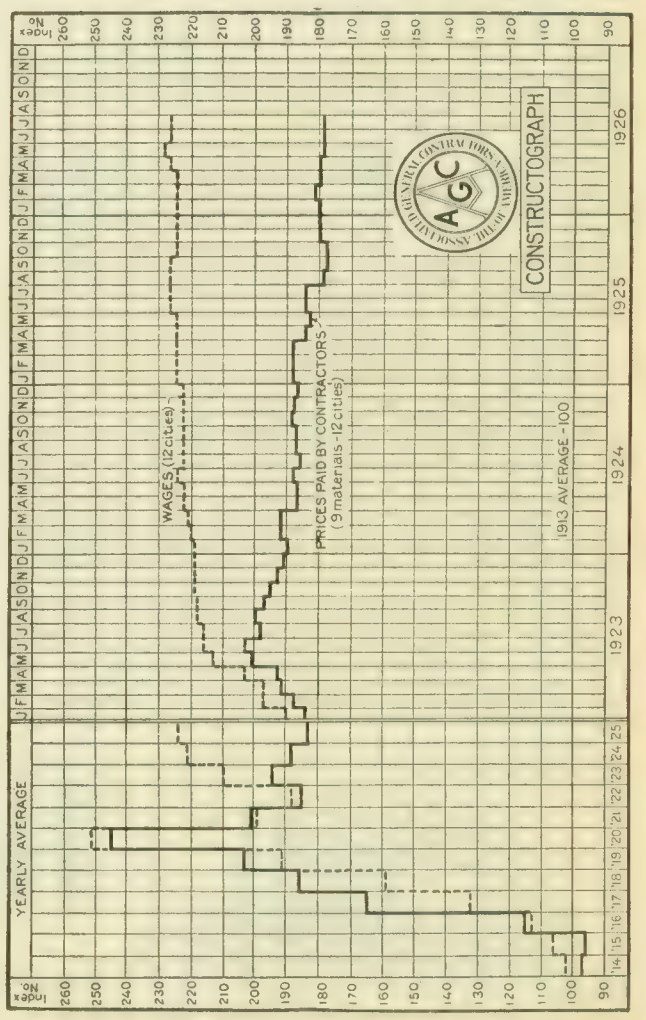
The construction work under way last month furnished a total 4 per cent. greater than that shown in June.

The total volume of construction performed during the first seven months of 1926 was 4% greater than the amount registered during the corresponding period last year. This fact assumes added significance, it is stated, when consideration is given to the trend of operations earlier in the year. Until the end of April, operations lagged behind the figures set at corresponding stages in 1925. It was in May that the present phenominal spurt started.



Construction costs have remained virtually on a single level since mid-summer of last year. They continue to hold to an average slightly less than twice as great as that established in 1913, according to statistics compiled by the Associated General Contractors of America.

The average of costs in the principal construction centers of the United States registered in July was identically the same as that marked down in June. It was at the present plane of costs that a three-month period without change was noted from November 1, 1925, to February 1, 1926. Fluctuations immediately preceding and following that period were insignificant.



The average of wages in the construction trades and average prices paid by contractors for building materials remained unchanged in July. Although minor fluctuations in prices of materials were noted, the general figures held their positions. Based on the 1913 average as 100, material prices are now established at index number 179, while wages hold to the 226 point level.

The material prices are now only one point above their lowest mark since 1922, set in August and September of last year. The average of wages, on the other hand is only two points below the record high mark of the past three and one-half years, established last March.

"The Oldest American Fire and Marine Insurance Company"

We Call It Tourist Baggage Insurance

but it applies to a week-end trip as surely as it does to a whole year of travel.

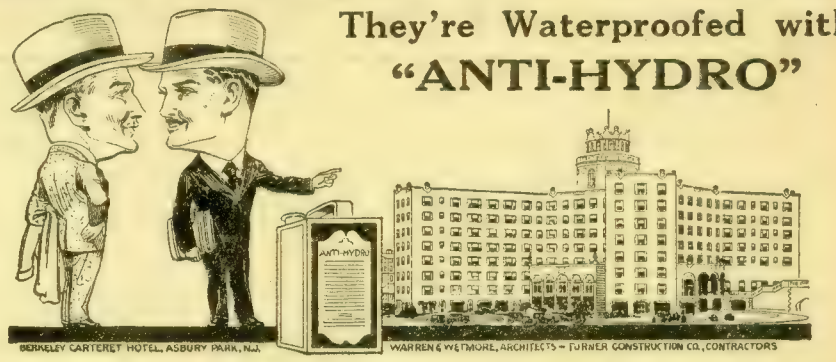
Tourist Baggage Insurance protects you from loss on your investment in baggage that is lost, damaged or stolen on trains, in the hands of transportation companies or in hotels.

Tourist Baggage Insurance is one of the most inexpensive forms of property protection we offer—and very practical protection at that.

Your agent or broker can get you a North America policy.

Insurance Company of North America

PHILADELPHIA



and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

Driving Rains and Salt Sea Air Cannot Penetrate or Stain These Brick Walls—

They're Waterproofed with

"ANTI-HYDRO"

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete **permanently.** Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

As The Editor Sees It

U. S. BUILDING SURVEY PROPOSED

Government Observers Agree on Need for Exact Knowledge of Housing Required in U. S.

BY HORACE H. HERR

Washington, August 4, 1926.

Even the most expert of the government experts always hesitates when it comes to making a positive forecast on the future of any and all industries. Inquiry in the Division of Building and Housing, U.S. Department of Commerce, develops nothing very definite as to the "official" opinion on the future of construction activities. Some of the observers profess to see evidence that the enormous deficit in buildings, incident to curtailed construction during the war, has been made up and that from now on, building activities may be said to be on a "normal" plane of activity. There is no doubt that the volume of building, in many eastern sections, shows some diminution and yet nothing indicative of a serious slump has developed.

There is one opinion, expressed, of course, in many different ways, to which most of the government observers subscribe. That is, the desirability of construction management making a final and exacting survey of methods and practices to the end that overhead costs and general expenses be cut to an irreducible minimum. No rash, indiscriminate cutting of forces is suggested. Rather, elimination of lost motion and wasteful methods is urged in the interest of maximum efficiency. As one official expressed it: "Better go over the ship's rigging and see that everything is seaworthy because calm weather doesn't prevail indefinitely."

The significant thing, perhaps, is the fact that business men are talking a great deal about "over production" and ways and means of marketing "surplus." So much discussion clearly suggests that someone sees the possibility of "over production" and embarrassing "surplus" in the not distant future. An example of this is the recent statement issued by Alvin E. Dodd, manager of the Department of Domestic Distribution of the Chamber of Commerce of the United States, in his address to the Society of Industrial Engineers at Philadelphia.

"The old conception of supplying an existing demand," said Mr. Dodd, "has been succeeded by the new question of creating a demand for a superabundance of supply.

"While our growth in population has been material, it is only about 16 per cent. above that of 1913; but accepting 30 per cent. as the increase in the facilities for manufacture, a capacity exists seriously in excess of what might be called the normal demand based on pre-war rate of production. I do not offer these percentages or the interpretation of them as other than suggestive. The population increase is based on more or less accurate estimates, while the increase in manufacturing facilities is guess pure and simple. But the picture, although somewhat blurred, is before us and its outlines may be recognized.

"This is your distribution problem. When something is produced for which there is no immediate demand the situation is like that of the railroad which has not sufficient traffic to keep it busy.

"As a result we see exaggerated forms of competition. We see extraordinary displays in advertising at extraordinary costs. We see new methods of distribution manifesting an extraordinary growth. And we see that latest ghost, installment selling, which is not appeased by anything less than the payment of next year's income for this year's product.

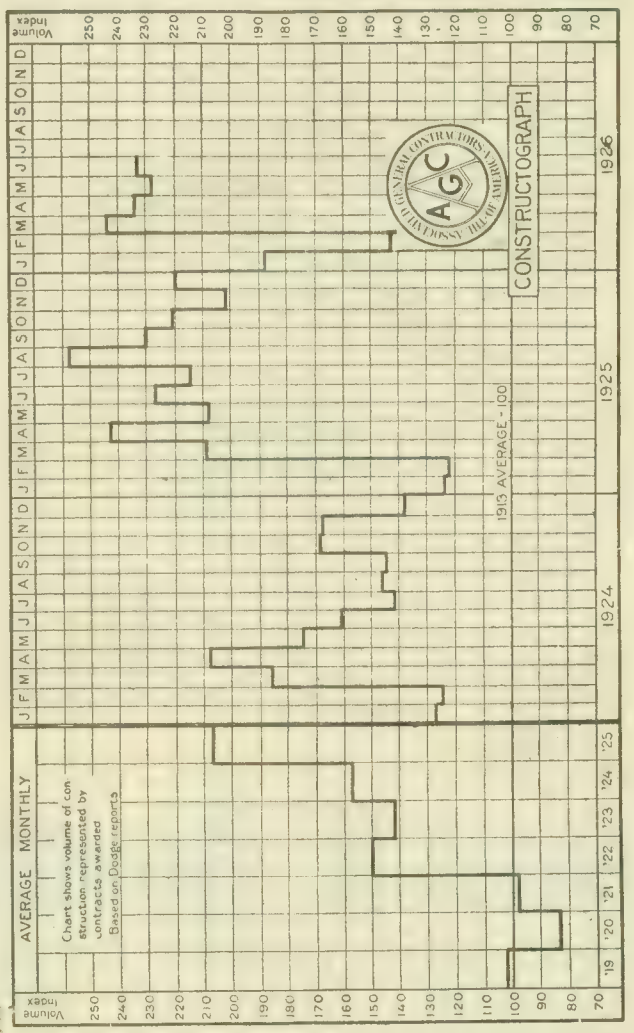
"I am not a calamity howler. There is a bright side to every cloud and every new manifestation in distributive methods has both an economic reason and an economic justification. The new method of selling by direct mail advertising not improbably will result in lessened cost of distribution. The extraordinary display of advertising has not increased materially, if at all, the cost of merchandise in such a manner as to burden the consumer. House to house canvassing, while we do not know its cost of distribution precisely, appears not to exceed the costs of other methods. Installment selling when rationally conducted and when surrounded by ordinary safeguards of credit is a great improvement upon the more or less irresponsible open book accounts which have prevailed in the past.

"This forced competition has exerted and will continue to exert pressure which results in lowered costs of production and these lowered costs will in time have a profound effect upon the retail price of merchandise."

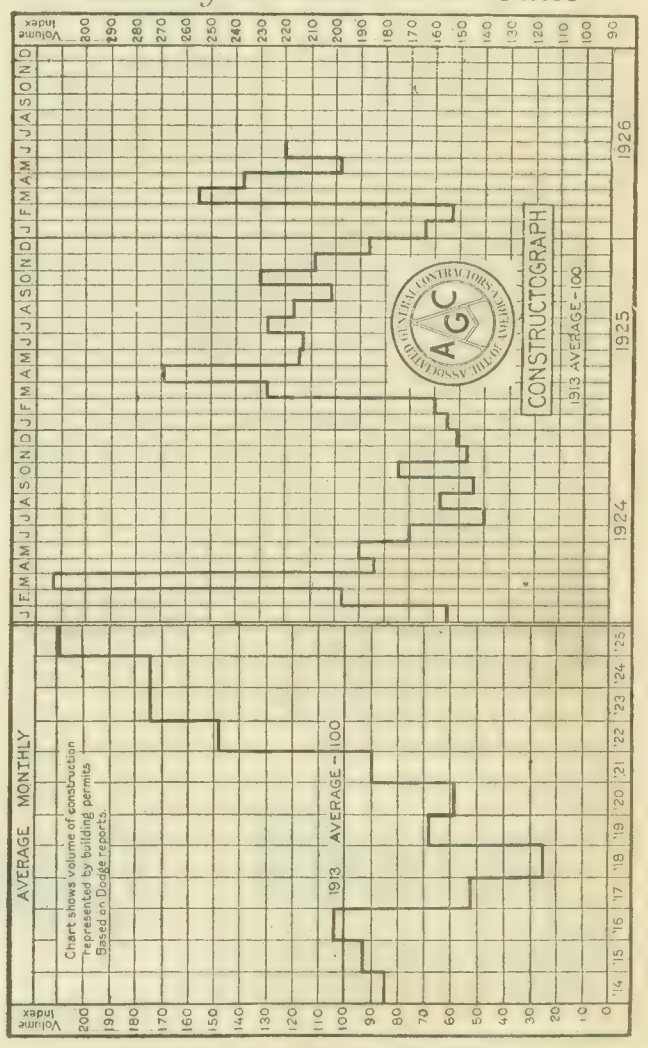
(Continued on page 547)

With construction operations being carried on at a furious pace, 1926 is considered certain to establish a new record for volume of building activities during a single year. An "eight billion dollar building year" is the possibility, according to indications drawn from statistics compiled by the Associated General Contractors of America.



The mere fact that the volume registered for the first seven months of this year is greater than that shown for the corresponding period last year would be sufficient in itself to warrant predictions of a new record, experts reviewing the situation here declare. It is in the recent increase in volume of contracts awarded and building permits issued, however, that the greatest significance is being placed.

The total volume of contracts awarded during the first six months of 1926 was 12 per cent. greater than the total for the corresponding period of 1925. The volume of awards in June was 2 per cent. greater than the total.



The volume of building permits issued during June was 11 per cent. greater than the May volume.

These figures indicate a vast amount of anticipated construction work, a large portion of which will soon be actually undertaken. With this condition in prospect, observers feel confident the "letdown" that would have to occur to prevent setting of a new record this year is far more a possibility than a probability.

SIX BILLION A YEAR FOR HOMES FACTORIES AND GENERAL CONSTRUCTION

Six billion dollars is a reasonable estimate of what the nation is spending for construction each year according to John M. Gries, Chief of the Division of Building and Housing, in a survey published in the new Department of Commerce Yearbook.

In spite of the magnitude of this program, according to Dr. Gries, it is only recently that the building of houses and construction of buildings, roads, canals, bridges, railroads, harbor works, subways, tunnels, water-supply systems, and other work that produces a more or less fixed structure or alteration of the natural topography, have been clearly recognized as a single industry.

The importance of the construction industry is hard to overemphasize. In value of product it ranks considerably above the automobile industry, the largest manufacturing industry, and about on a par with railway operating receipts. Variations in construction activity from year to year have a large share in determining the prosperity of other major industries such as railways and lumber mills. Construction affects scores of manufacturing industries, and bears some relation to retail trade and to the individual incomes of practically every family in the country.

Existing construction underlies the whole economic organization of the country. The production of its manufacturing industrits is carried on mainly in buildings, of course, but depends even more on the physical network of railways, highways, telephone and teltgraph systems, and lines for the transmission of power and water, all of which are in large measure the products of construction. Living standards of the people depend very largely on the character of dwellings, on the availability of water, sewerage, gas, and electricity, and the accessibility of varied recreational facilities, and on the streets and roads which enable them to get from place to place. There is a measurable relation between the character of dwellings and health. The schools require a great number of buildings in order to do their work effectively.

The volume and character of new construction is of great importance. The million and a half to two million increase in population each year requires new dwellings, increased manufacturing facilities, and increased public utilities and other types of construction. Structures worn out or destroyed must be replaced. If living standards are to improve and people are to occupy better houses, continued large construction programs are needed. Some types of construction add to the productivity of industry. In general, progress depends largely on the Nation's devoting a due proportion of its energies to construction.

As Secretary Hoover has stated, "Our national savings are accumulating at an unparalleled rate, and it is especially desirable to have them invested now in domestic permanent capital improvements which contribute directly to the well-being of our people, for by such devotion of our savings we both encourage thrift and raise the standard of living."

Probably half the construction in the United States today, measured in value, is less than 30 years old, and another 30 years hence a backward look to the present is likely to show a similar situation.

FIRE RESISTANCE OF HOLLOW BUILDING TILE DETERMINED AT BUREAU OF STANDARDS

8-Inch Walls Adequate for Residences

Teests to show the behavior of tile walls in burning buildings, which the Bureau of Standards, Department of Commerce, has been conducting on hollow tile in co-operation with the Hollow Building Tile Association, were reported in a paper read before the building officials of the principal cities of the United States at their recent annual meeting in Columbus, Ohio.

These tests were planned to yield more information on the properties of hollow tile, such as the strength of tile walls, and more especially the fire resistance of such walls. This report was concerned principally with the fire tests.

Two sizes of walls were tested—one 16 feet long and 11 feet high, the other 4 feet long and 4 feet high. The walls were built just as they would be built in a building and when they had aged a month or more they were placed to form one side of the furnace in which the tests were made. The fire in the furnace was regulated during the test so as to approximate that obtained in severe fires in burning buildings.

The tests show the ability of tile walls to carry load during the burning of a building and also to prevent the spread of fire when they are used as party or fire walls. They show that 8-inch tile walls would be adequate for residence and office buildings and institutions in which no considerable amount of combustible material is allowed to collect.

For stores or factories containing only a moderate amount of combustible material a 12-inch wall would be required. For factories having a considerable amount of combustible material or for warehouses, a wall heavier than 12 inches would be required, particularly if the wall is not plastered.

The results of these tests are considered of great value to the industry and the public, as well as to the building commissioners, in that they give reliable information on the extent to which hollow tile walls can be relied upon for protection in case of fire.

"The special pamphlet on "PERTINENT POINTS ON BUILDING INVESTMENT" just prepared by the Better Building Committee of the AMERICAN CONSTRUCTION COUNCIL gives suggestions on the more important things that the public should keep in mind in buying real estate securities on contemplated or new building construction. Being representative of the opinion of all component parts of the construction industry that go to make up the Council it is impartial in nature and therefore carries unusual weight.

"Certainly no question is of more far-reaching scope or greater importance to all elements of our citizenship than the question of better building. In some fashion or other it hits us all—as investors, owners, manufacturers, designers of buildings, employers, labor, renters, payers of insurance, and the like. Questions of health, safety and comfort of living also enter into it.

"One of the most important phases of the entire problem of better building is the sound financing of building structures from the standpoint of the protection of the public who buy building securities.

"The average member of the investing public whose money goes into mortgage bonds or other forms of financing building construction seldom possesses the information necessary to make a wise selection of securities, nor does he appreciate what points such data should cover.

"Some real estate securities are good; some are bad; some are fair; some are highly speculative. Every building must be considered as a separate problem.

"There are many items that go to make up a sound real estate security, and they must be borne in mind by the building investor.

"Taking for granted such points as a reliable loaning institution and proper location and design for the purpose for which the building is needed, the most important thing is of course first class construction.

"The passing of the acute building shortage with its short-lived building boom, and the return to normal consideration of building costs and values makes structures of inferior quality an increasingly heavy liability.

"The public must be most cautious about the kind of construction on which, and the concerns to whom it lends its money for building investment."

Copies of this pamphlet can be secured from American Construction Council, 28 W. 44th St., New York City.

"The Oldest American Fire and Marine Insurance Company"

We Call It Tourist Baggage Insurance

but it applies to a week-end trip as surely as it does to a whole year of travel.

Tourist Baggage Insurance protects you from loss on your investment in baggage that is lost, damaged or stolen on trains, in the hands of transportation companies or in hotels.

Tourist Baggage Insurance is one of the most inexpensive forms of property protection we offer—and very practical protection at that.

Your agent or broker can get you a North America policy.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

Acids Do Not Harm these Concrete Floors—

L. A. Dreyfus Building, Rosebank, Staten Island, N. Y. Turner Cons't. Co., Engrs & Contrs.

They're Protected with "ANTI-HYDRO"

The concrete floors in this building are constantly covered with acids and water which would quickly deteriorate them if they were not hardened and waterproofed with "ANTI-HYDRO."

Although these floors have been in constant use for many years, "ANTI-HYDRO" has fully protected them from wear, water and the action of the acids.

"ANTI-HYDRO" is a liquid integral agent that mixes easily with the gauging water—no skilled labor is required. It hardens and waterproofs concrete and makes it acid, alkali and oil-resisting all in **one operation.**

For 22 years "ANTI-HYDRO" has been the accepted standard. Results are **guaranteed permanent.** Use "ANTI-HYDRO" on your next job.

BRICK

THE BAPTIST HOME

just nearing completion on Roosevelt Boulevard opposite the Shriner's Hospital is faced with a brick of unusual texture and beauty of coloring appropriately called

SHELLBARK

It was chosen by the architect, Mr. Horace W. Castor, Stephen Girard Building, who is highly pleased with the effect secured. The colors vary from a light red to a deep purple and mingled in pleasing contrast are olive browns and greens all secured thru the method of burning the natural shale.

Wherever you have a background of green lawn or trees for large masses of brickwork SHELLBARKS will harmonize to give a permanently pleasing result.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Pennsylvania Contracts Awarded

Wagon Shed and Stable, Chester pike and Quarry street, Darby, Pa. Architects, The Stuckert Co., Crozier Building, Philadelphia. Owner, W. H. Snell, on premises. Lessee, Scott-Powell Co., on premises. WORLD FAMOUS STRUCTURES-

THE BELFRY, AT BRUGES, BELGIUM

THE VAN SCIVER CORPORATION V SERVICE

THE VAN SCIVER CORPORATION V SERVICE

THE Belfry Tower, at Bruges, Belgium, is an elegant Gothic structure, rising to the height of 325 feet. The building from which it rises was, in olden days, a Trade Hall, but part of it was later occupied as a meat market.

It was built in the Fourteenth Century, by the citizens, as a kind of monument of the power and wealth of their feudal lord.

This structure originally served as a watch tower from which the approach of an enemy could be discerned; while the forty-eight bells which hang in the belfry were tolled to call the citizens to arms.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., August 24 ,1926. Sealed Proposals will be opened in this office at 3 P. M., September 14, 1926, for construction and extension to the driveway and underpinning of retaining wall at the United States Post Office, Pottsville, Pa. Drawings and specifications may be obtained from the Custodian or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

HERE'S THE LATEST SCHEME TO BEAT FATHER TIME

Whitewashing a common brick house and letting nature take its course produces an aged appearance with remarkable celerity

Whitewashing brick walls to accelerate their taking on the appearance of age is coming more and more into practice. It isn't a vogue that has developed in any one particular section; it seems to be nation-wide and growing. Perhaps, if anywhere, it predominates in the North, and it may have had its inspiration from the effects attained in the old Spanish architecture of the South and Southwest.

It isn't by any means a new resort. Throughout the Southern European country, along the Mediterranean, it has been a practice for ages. One encounters this effect constantly in the old Italian cities where the brick walls have been covered in many instances not only with whitewash, but first with a heavy coating of cement. In Spain it is a universal custom to use this cement coating.

In America the practice of coating brick walls with cement has nowhere been developed to a greater degree than in the old section of New Orleans. This was under Spanish dominion more than a century ago, but the walls still stand. And if merely an appearance of age is desired one will have to go far to find better

examples. Not all of these have been whitewashed. Some of them never have been. It hasn't been necessary. Time has done its work unaided.

One can give an ordinary wall of common brick a single coat of whitewash, forget all about it, and in a little matter of from two to three years, depending largely upon the weather conditions, he may have a home or ground trimmings that in the point of appearance will very successfully rival any European survival of the 15th century. It is really astonishing what a change will be wrought.

Under the action of the elements the whitewash wears away gradually, exposing the darkness of the brick underneath and producing a peculiar merging of mottled shadings that is altogether delightful in its appearance of extreme age. Care should be exercised in the initial application of the whitewash not to have it too heavy. A thickness sufficient to result in chipping off in flakes fails inevitably in producing the desired effect. The whitewash is not intended to come away in chunks; the ideal result is to have it simply wear away and through.

One not inconsiderable advantage to the builder who plans a whitewashed house is that he need lose neither time nor sleep over the selection of the brick he intends to use. Any well-burned common brick will answer. And when the home is ten years old he will have something that will look like it had simply been upthrust from the earth some centuries back, and had settled back into harmonious lines.

Possibly of all the various types of architecture the English fits most effectively into the scheme of whitewashing. Chiefly this is due to the effect that may be produced with its usual broad expanse of roof appropriately trimmed with a thatch-like heavy slate whose varying colors may be made to blend harmoniously with its surroundings. The long slope of slated roof which seems simply to melt away into the foliage of the adjacent evergreens is invariably and peculiarly appealing.

Throughout the East the use of common brick with this coating of whitewash is growing tremendously in the residence construction field. Hundreds of such homes have been built during the last few years in the smaller towns adjacent to New York City. The idea is taking strong hold through New England and not only in the Philadelphia district but westward through Pennsylvania it is also taking root. Farther West in Cleveland and Chicago, particularly the latter, whitewashed homes and brick garden walls are becoming a feature rivalled only by that other common brick development, skintled brickwork.

In Cleveland one of the most conspicuous examples of whitewashed residence was built several years ago in the exclusive Heights residence district entirely of common brick, largely second-hand. When it was completed the whitewash was applied and today there is not a more attractive home anywhere in its very aristocratic neighborhood.

Chicago's environs are dotted with common brick homes with the whitewash treatment. Many of these have carried the effect into the decoration of the grounds as well and brick garden walls have been similarly treated. Many of these are of but recent construction but there are some that are already beginning to evidence what may be expected within the next few years. And they are altogether assuring.

No type of home fits so well into a carefully landscaped surrounding as the one that has been subjected to a coat of whitewash. Nowhere does one encounter such a delightful contrast as that furnished by the close contact of whited wall and luxuriant evergreen. And how a bit of climbing ivy accentuates it all! Where one is fortunate in having wooded backgrounds the effect cannot be surpassed. Always there is a satisfying sense of beauty and comfort more than ordinarily combined. —*Building Economy.*

TO DANGER IS ADDED ABSURDITY

More and more is being emphasized the absurdity of the effort of the cement interests to change the definition of brick. It is not only absurd but it is dangerous. Better proof of both contentions could hardly be asked than is furnishing in this little item which has been floating around rather promiscuously of late in the building supply and other trade publications:

"Bricks prepared from shredded fibers of palmetto, sea grass or other similar materials have appeared on the building markets and are said to have proved satisfactory in various types of construction. They are considerably larger than the ordinary brick and can be arranged to form their own mold for reinforcing pillars of concrete, or on like jobs."

What will happen to firsesafe construction if such material as this is permitted to slip into a general classification of brick? Just about how much fire resistance could be expected from a product made of sea grass, or palmetto fiber, or similar material?

Yet it would have the same right to be called a brick as would the cinder-concrete product in whose interest the effort is being made.

Changing the definition along the broad lines advocated by the cement interests would be merely licensing substitution and opening the gates to shoddy construction to a degree never possible in the past.

The most surprising feature of it all is that the dictionary publishers ever gave the suggestion even a moment's consideration.

Its menace to the stability of honest construction should have condemned it at sight.—*Building Economy.*

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

Acids Do Not Harm these Concrete Floors—

L. A. Dreyfus Building, Rosebank, Staten Island, N. Y. Turner Cons't. Co., Engrs. & Contrs.

They're Protected with "ANTI-HYDRO"

The concrete floors in this building are constantly covered with acids and water which would quickly deteriorate them if they were not hardened and waterproofed with "ANTI-HYDRO."

Although these floors have been in constant use for many years, "ANTI-HYDRO" has fully protected them from wear, water and the action of the acids.

"ANTI-HYDRO" is a liquid integral agent that mixes easily with the gauging water—no skilled labor is required. It hardens and waterproofs concrete and makes it acid, alkali and oil-resisting all in **one operation.**

For 22 years "ANTI-HYDRO" has been the accepted standard. Results are **guaranteed permanent.** Use "ANTI-HYDRO" on your next job.

PERTINENT POINTS ON BUILDING INVESTMENT

Suggestions to Investors and Owners as to buying Real Estate Securities on Contemplated or New Building Construction

Issued by the American Construction Council

Foreword

The average member of the investing public whose money goes into mortgage bonds or other forms of financing building construction seldom possesses the information necessary to make a wise selection of securities, nor does he appreciate what points such data should cover.

Some real estate securities are good; some are bad; some are fair; some are highly speculative. Every building must be considered as a separate problem.

There are many items that go to make up a sound real estate security, and they must be borne in mind by the building investor.

Taking for granted such points as a reliable loaning institution and proper location and design for the purpose for which the building is needed, the most important thing is first class construction.

The passing of the acute building shortage with its short-lived building boom, and the return to normal consideration of building costs and values make structures of inferior quality an increasingly heavy liability.

The public must be most cautious about the kind of construction on which, and the concerns to whom it lends its money for building investment.

WHAT TO CONSIDER

Point I.—Deal only with Reliable Investment Houses or other Loaning Institutions.

It is well to obtain advice from several independent sources as to the proper kinds of investment houses for your purposes. For sound investment, both safety for and return from your money are essential. The problem is to get the proper balance between the two for your own particular needs.

In all cases safety and return on the investment must be sought. As the former increases the latter decreases. To what extent this goes in any given case, however, depends upon various factors that are common to all sound real estate securities.

First among these comes the reputation and good business judgment of the institution that issues the mortgage bonds or other securities. You should satisfy yourself of the soundness of the institution and its business methods, not only in its dealings with you as an investor, but also with the owner, the builder and the management of the building, the continuous earning capacity of which pays the interest on the securities for which it is collateral.

Not only the judgment of the loaning institution in loaning the money for the construction of a new building, but also the measures that the loaner takes to insure that the building is well built, and properly managed, are most important, for it is to the loaning institution that the individual investor must look for the satisfactory handling of these matters.

An adequate sinking fund to insure full payment of the loan when due and proper amortization are other important factors.

Point II.—Consider the Purpose of the Building

The prospective investor should consider the purpose for which the building is being erected, whether it is to be used as an office building, apartment hotel, apartment house, hotel, loft, warehouse, etc. He should bear in mind whether the future, as well as the present demand for such a building will make it

a good earning proposition. A loan which may be justified for one type of building at a given time or place would be folly for another type.

Point III.—Make Sure the Location is Good.

Consider the location of the building as related to its use. An office building might be placed, for example, where few people would wish to have their offices. Transportation facilities are a most important factor. The general character of the surroundings is likewise important.

Of great import, too, is the possible future shifting of business and residential centers. A location which may be excellent at the time an office building, for example, is erected might prove disastrous because of future changes in the business district.

Point IV.—Consider the General Type and Design of the Building.

Although the purpose of the building may be well conceived and a good location secured, it is essential that the general type and design of the building harmonize with these factors. For example, an apartment hotel, if a high grade of tenancy is desired, should not be built to look like a loft building.

The building should not only be adapted to the use to which it is to be put but also should be designed and laid out to combine beauty and utility.

Point V.—Be Certain that the Quality of Construction is Good.

First class construction, including materials and workmanship for both interior and exterior, is absolutely essential. Otherwise what may appear on the surface to be a well-built building may deteriorate after a few years and become a costly burden because of heavy repair bills, maintenance costs and loss of tenants. Materials and types of construction should be used which will suffer the least possible obsolescence.

It is essential, of course, to bear in mind that as a general proposition no more than enough should be spent on a building than is necessary to create an economic and well appearing improvement.

Point VI.—Consider Carefully the Earning Capacity of the Building.

After all it is the continuous earning capacity of the building as a complete service unit that determines the real value of the bond or other security placed upon it. This depends upon the initial cost of the building and also upon present and future market conditions for the type of tenancy which the building is intended to serve.

Such factors, therefore, as reasonable construction costs, including the cost of the land, of building and of financing, taxation, assessments and the like are important. To determine this requires an appraisement of the entire property, both land and buildings, which should take into consideration the purpose for which the building is to be used.

General market conditions for the sale and rental of buildings of similar types in the same locality, and probably future trends are equally important. The general affect of construction conditions and possibile new construction of similar types in the same and competing localities needs to be studied.

Point VII.—Bear in Mind Also the Kind of Management the Building Will Have After Completion.

Nobody would consider investing his money in a poorly run factory or railroad if he knew such conditions existed. Yet frequently the investor gives no thought to the kind of management a building will have once it has begun operation.

Without good management, a good building will sooner or later prove a poor investment. The prospective investor should make certain that the terms of the loan require that the owner provide and maintain first class supervision of the building in every way.

PROPERTIES AND MANUFACTURE OF CONCRETE BUILDING UNITS DESCRIBED IN NEW PUBLICATION OF BUREAU OF STANDARDS

While concrete units have long been used in building construction it is only within the past few years that the manufacture of concrete brick, block, and tile has attained a rapid growth. This growth has been brought about largely by the heavy demand for building materials and the efforts of interested associations in bringing to the attention of the public the desirable features of concrete units.

Numerous inquiries are received at the Bureau of Standards, of the Commerce Department from people who are interested in learning more of the properties of concrete units and the details of the manufacturing methods. In order to answer these questions in a reasonably complete manner, a circular has been prepared covering the essential features of concrete brick, block, and building tile, and giving some general information about their manufacture.
